Waitlist Registrations, Not Removed for Transplant	95
All Waitlist Registrations	134
<b>Appendix</b>	<b>159</b>

## Executive Summary

The following report provides an extensive descriptive analysis of deaths from two time periods, as well as an overview of the external deaths verification process UNOS employs to supplement OPTN member-reported deaths information in the OPTN database. Characteristics reviewed included age, race/ethnicity, education level, insurance type, sex, state and center, among some enumerations of time to death from transplant or waitlist removal. First, deaths added to the OPTN database during the February and March 2022 external deaths verification process are characterized. During this time frame, enhancements to the external deaths verification process occurred that allowed for the automation of what was a previously manual review of obituary data. This led to a bolus of deaths verified and thus added to OPTN data. Deaths for transplant recipients as well as waitlist registrations (not removed for transplant) were characterized.

Most deaths were transplant recipients that received transplant around 2006, and 90% of these transplant recipient deaths occurred between 5 to 25 years post-transplant. Across organs, the majority of these deaths for transplant recipients occurred after lost to follow-up; however, over half of pancreas and close to one-third of kidney transplant recipient deaths occurred after graft failure. OPTN policy currently requires reporting of follow-up or patient events until either death or graft failure occurs. Overall, 21% of these transplant recipient deaths were Black, Non-Hispanic and 12% were Hispanic/Latino. When waitlist registrations (not removed for transplant) were reviewed, most deaths had removal dates around 2015, with 59% of waitlist registration deaths occurring over 5 years after removal. Of these waitlist registration deaths, 27% were Black, Non-Hispanic while 14% were Hispanic/Latino.

The second set of deaths to be characterized were those deaths that occurred between January 1, 2005 through December 31, 2021 to look at longer term descriptive patterns across sources of death information. Sources of death information were categorized as “Member Reported” (coming from OPTN members and included in OPTN database), “External Verification” (verified through external sources of death and included in OPTN database), or “Unverified” (from external sources of death that were unable to be verified and not included in OPTN database). Deaths for transplant recipients as well as waitlist registrations (not removed for transplant) were characterized.

Again for this larger cohort of deaths, most deaths were transplant recipients that received transplant around 2006. These deaths occurred most often between 5 to 20 years post transplant (57% member reported, 74% external verification, 72% unverified). While the majority of member reported deaths were reported during follow-ups with no graft failure events (64%), external verification deaths occurred after lost to follow-up (58 - 67% per organ) or graft failure (kidney, kidney-pancreas, and pancreas organs, 42 - 61%). The largest proportion of unverified deaths occurred after lost to follow-up (42%). The largest proportion of transplant recipient deaths for Black, Non-Hispanics and Hispanic/Latinos per organ was for kidney. Overall, the proportions of member reported, external verification, and unverified deaths that were Black, Non-Hispanic were 18%, 24%, and 22%, while the proportions that were Hispanic/Latino were 10%, 12%, and 21%, respectively.

Lastly, for the larger cohort of waitlist registration deaths, there were increased volumes of deaths removed from the waitlist after 2005, which aligns with the defined cohort of interest. There was a more gradual increase in the number of externally verified deaths removed from 2012 on, aligning with the introduction of the external verification process in 2012. By organ, the percentage of waitlist registration deaths within unverified death sources was larger than external verification and member reported death sources for Hispanic/Latinos. Again, kidney waitlist registration deaths has the highest proportions of Black, Non-Hispanics across death sources. Overall, the proportions of member reported, external verification, and unverified deaths that were Black, Non-Hispanic were 24%, 25%, and 26%, while the proportions that were Hispanic/Latino were 15%, 15%, and 25%, respectively.

This report does not investigate the impact to further metrics, such as post-transplant survival rate calculations or waitlist mortality rates. Further review of the distributions and key subgroups presented here that may be most impacted by the enhancements to the external verification process and potential biases in source of death information will provide guidance for further evaluation of metric impacts from this data.

## Background/Purpose

During the full committee teleconference on May 9, 2022, a brief presentation was provided on the background of the OPTN external verification of deaths history and the recent announcement of the enhancements made to this process. Following this presentation, concerns and additional questions were raised regarding the bolus of roughly 35,000 deaths added to the OPTN data and characteristics of these data, as well as the remaining impact of additional unverified deaths and implications for OPTN data quality.

## Strategic Plan Goal or Committee Project Addressed

Provide equity in access to transplants – continually increase the quality of OPTN data collected and explore the use of external data source to supplement policy-making and research.

## Committee Request

1. Using the cohort of approximately 35,000 deaths recently added to OPTN data in February and March 2022 through the external verification process, provide counts and percentages of deaths by:
  - Type of death - waitlist registrations not removed for transplant (deceased or living donor) and transplant recipients (deceased or living donor), overall and by organ
  - Year of death, overall and by organ
  - Type and year of death, overall and by organ
  - For transplant recipients,
    - Year of transplant, overall and by organ
    - Years from transplant to death ([0, 1), [1, 3), [3, 5), [5, 10), [10, 15), [15, 20), [20, 25), [25, 30), [30, Inf] ), overall and by organ
    - Death after graft failure, death after recipient reported lost to follow-up, other; overall and by organ
    - Age at transplant (<1, 1-5, 6-10, 11-17, 18-34, 35-49, 50-64, 65+), overall and by organ
    - Race/Ethnicity (Asian, Non-Hispanic; Black, Non-Hispanic; Hispanic/Latino; Multiracial, Non-Hispanic; Other, Non-Hispanic; White, Non-Hispanic), overall and by organ
    - Sex (male, female), overall and by organ
    - Education level (less than college or GED, college or GED and higher), overall and by organ
    - Primary source of payment (public, private), overall and by organ
    - State of transplant program where transplant was received, overall and by organ
    - De-identified transplant program, overall and by organ
  - For waitlist registrations not removed for transplant,
    - Year of removal, overall and by organ
    - Time from removal to death (While Waiting, 1-7 days, 8-14 days, 15-30 days, 31-60 days, 61-90 days, 91-180 days, 181 days – 1 year, 1-3 years, 3-5 years, > 5 years), overall and by organ
    - Removal reason (Still Waiting, Too Sick to Transplant, Condition Improved, Unable to Contact, Refused Transplant, Death, Other), overall and by organ
    - Age at removal, overall and by organ
    - Race/Ethnicity, overall and by organ
    - Sex, overall and by organ
    - Education level, overall and by organ
    - Primary source of payment, overall and by organ
    - State of listing transplant program, overall and by organ
    - De-identified transplant program, overall and by organ
    - For the subset of waitlist registrations removed for death on the waitlist list, status at time of removal, overall and by organ
2. Using the cohort of all deaths that occurred during January 1, 2005 through December 31, 2021, provide counts and percentages of deaths stratified by generic source of death (reported by OPTN member, OPTN data; externally verified source, OPTN data; and unverified, not OPTN data):

- Type of death - waitlist registrations not removed for transplant (deceased or living donor) and transplant recipients (deceased or living donor), overall and by organ
- Year of death, overall and by organ
- Type and year of death, overall and by organ
- For transplant recipients,
  - Year of transplant, overall and by organ
  - Years from transplant to death, overall and by organ
  - Death after graft failure, death after recipient reported lost to follow-up, death after not seen, other; overall and by organ
  - Age at transplant, overall and by organ
  - Race/Ethnicity, overall and by organ
  - Sex, overall and by organ
  - Education level, overall and by organ
  - Primary source of payment, overall and by organ
  - State of listing transplant program, overall and by organ
  - De-identified transplant program, overall and by organ
- For waitlist registrations not removed for transplant,
  - Year of removal, overall and by organ
  - Time from removal to death, overall and by organ
  - Removal reason, overall and by organ
  - Age at removal, overall and by organ
  - Race/Ethnicity, overall and by organ
  - Sex, overall and by organ
  - Education level, overall and by organ
  - Primary source of payment, overall and by organ
  - State of listing transplant program, overall and by organ
  - De-identified transplant program, overall and by organ
- For all waitlist registrations (any removal reason),
  - Year of removal, overall and by organ
  - Time from removal to death (While Waiting, 1-7 days, 8-14 days, 15-30 days, 31-60 days, 61-90 days, 91-180 days, 181 days – 1 year, 1-3 years, 3-5 years, > 5 years), overall and by organ
  - Removal reason (Still Waiting, Too Sick to Transplant, Condition Improved, Unable to Contact, Refused Transplant, Death, Other), overall and by organ
  - State of listing transplant program, overall and by organ
  - De-identified transplant program, overall and by organ

3. In addition to the above data distributions, the following informational items will be provided:

- Mapping of OPTN death data source types and relationships, and any changes in this mapping or linkages that have occurred over time
- Current sources of supplemental data included in OPTN data files and fields impacted (e.g., death, but also graft failure, etc)
- Update and impact of additional living donor deaths to OPTN data
- Outline of differences and data sets used by UNOS for OPTN-related work and those made available in the public OPTN STAR file
- Confirmation of which data files (OPTN STAR and/or SRTR SAF) included unverified deaths prior to their removal
- Differences in death verification processes employed by UNOS and SRTR and drivers of potential discrepancies in OPTN STAR file and SRTR SAF file death counts
- Confirmation of whether CMS data on deaths post-graft failure for kidney patients is being used, similar to dialysis dates data from CMS crown data
- Explanation of extent verification of deaths is reliant upon transplant center reporting of deaths to the OPTN

## Data and Methods

### Data Sources:

OPTN data on transplant candidate and recipient deaths reported to the OPTN by OPTN members, identified through external data sources and verified for inclusion with OPTN data, and non-OPTN data on transplant candidate and recipient deaths from external data sources that were not verified and not included in OPTN data.

### Cohort:

Externally verified deaths data from obituary and LexisNexis data sources included in the OPTN database during March 2022.

Deaths data (OPTN and non-OPTN) with death dates during January 1, 2005 through December 31, 2021.

For the subset of waitlist registrations not removed for transplant, registrations for patients with the following removal reasons were **excluded**:

- Deceased donor transplant, removed by transplanting center
- Transplant at another center (multi-listed)
- Living donor transplant, removed by transplanting center
- Deceased donor emergency transplant
- Deceased donor multi-organ transplant
- Patient died during transplant procedure
- Transplanted in another country
- Patient died during living donor transplant procedure

## Results

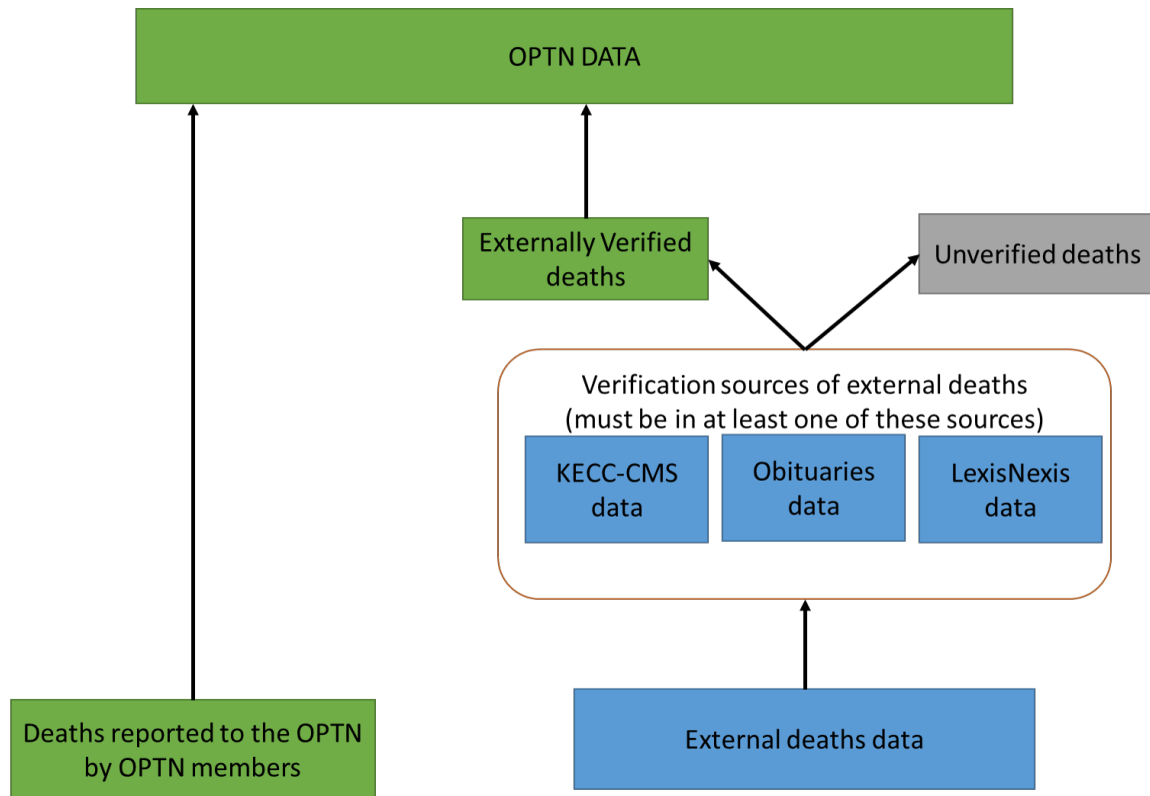

A timeline of the data collection process with respect to deaths information that was provided during the May 9, 2022 meeting is also provided here again.

- **1988**: OPTN data collection begins
- **2004**: OPTN database supplemented with external sources of death
- **2011**: Broad access to external sources of death was greatly restricted outside of federal agency usage (<https://ladmf.ntis.gov/docs/import-change-dmf.pdf>)
- **2013**: OPTN establishes death verification process (<https://unos.org/news/optn-to-implement-new-process-for-patient-status-verification/>)
  - A manual, labor-intensive process of independently verifying some external deaths by a secondary source in order to augment OPTN data
  - Due to the time-consuming nature of this task, OPTN had to prioritize efforts to focus on deaths relevant to SRTR's PSR cohorts for one- and three-year survival rates
- **2017**: OPTN publishes sensitivity analysis on impact of external sources of death versus OPTN member-reported deaths (Wilk, Amber R., Leah B. Edwards, and Erick B. Edwards. "The effect of augmenting OPTN data with external death data on calculating patient survival rates after organ transplantation." *Transplantation* 101.4 (2017): 836.)
- **2022**: OPTN adopts a new, more automated death verification process (<https://optn.transplant.hrsa.gov/news/optn-death-verification-process-improvements-will-yield-updated-numbers-beginning-in-april-2022/>)
  - Reduced the resource-intensive manual process
  - Now attempts to verify all externally sourced deaths, not just deaths affecting PSR cohorts

Below is a high-level flow diagram of how deaths information is included in the OPTN database. Per signed Data Use Agreements (DUAs) and Non-Disclosure Agreements (NDAs), we cannot disclose the external deaths data source(s), but can share the current verification process for incorporating this information into the OPTN database. All recipient, candidate, and living donor deaths that are reported by OPTN members are included in the OPTN database without further verification required. External data on deaths is obtained on all transplant candidates and recipients in the OPTN database that do not have a death event reported to the OPTN by the member. This

is then processed through the three listed verification sources and must be identified in at least one of the three sources to be included in the OPTN database.

Figure 1: A high-level overview of how deaths data is incorporated into the OPTN database.

In this diagram, KECC-CMS (University of Michigan Kidney Epidemiology Cost Center) data includes information from a combination of CMS (Centers for Medicare & Medicaid Services) data sources, such as CROWNWeb, CMS Medical Evidence Form (Form CMS-2728), Medicare, and ESRD (End Stage Renal Disease) data. LexisNexis data is from an enterprise data analytics company providing information from various public claims records. Lastly, obituary data includes information from the previously manual process to identify and verify obituaries as well as from the new, automated process as of early 2022, allowing UNOS to expand to checking all recipient, candidate, and living donor deaths in the database rather than those in the most recent PSR cohort time period. This is largely the basis of the data presented in the section “New Deaths Externally Verified in February/March 2022” below.

The death status and date from external verification source(s) does not override anything already recorded by OPTN members. If an external data death cannot be verified within at least one of the three listed verification sources, it is not included in the OPTN database and is not considered a death event. In many cases, externally verified deaths eventually become member-reported deaths as follow-up visits by members with their patients occur.

Per current OPTN Policy *18.1 Data Submission Requirements*, transplant hospitals are required to submit organ-specific transplant recipient follow-up forms (TRF) within *either* of the following:

- 30 days\* after the six-month and annual anniversary of the transplant date until the recipient’s death or graft failure
- 14 days from notification of the recipient’s death or graft failure

\*\* note that this time frame will be changed to 90 days, effective with the implementation of the *Modified Data Submission and Data Lock policy*.

Member-reported deaths are not impacted by externally verified death data, as this information takes priority. Due to the temporal sequencing of the process and when TIEDI forms are required to be submitted, it may be the case that information on a death is found via externally verified sources and included in OPTN data but later added and confirmed by the member as well. The information provided by the OPTN member, which includes additional items such as cause of death, trumps the externally verified source information. Calculated fields in the OPTN STAR files may use externally verified death data under some circumstances. For example, “Composite Death Date” includes member-reported deaths as well as externally verified deaths, and other fields such as “PSTATUS” and “PTIME”, for patient survival status and patient survival time, are calculated based on this.

Currently there are no other data fields included in the OPTN STAR file that are supplemented by external data sources in a similar manner. The OPTN STAR file has not ever included unverified deaths information. The documentation for the OPTN STAR file includes information on where each variable originates from in the system (TIEDI form, Waitlist, DonorNet, etc) or whether it is a calculated variable.

UNOS did not begin receiving externally verified deaths for living donors until early 2022 and is continuing to work on incorporating these into the OPTN STAR file. Only those living donor deaths reported by OPTN members are currently included in the OPTN database. Additional updates and communications will be forthcoming on this effort.

While the OPTN cannot speak to SRTR practices for internal and SAF file analyses, we can outline the data UNOS analyzes in various situations. When UNOS performs analyses for or on behalf of the OPTN, we typically use a more recent, but similar, data set to that which is publicly available as the OPTN STAR file. We use a cut of the data from the OPTN database as of the previous Friday. This includes information on deaths reported by OPTN members as well as from externally verified sources. The OPTN has access to, and it is permissible to use, all deaths in aggregate including those that remain unverified from external sources; however, this is not often done. If such an analysis is performed, the methods and titles of all data and information clearly denote this.

The semi-annual “Patient Status Confirmation Link” process in the Data Services Portal allows members to report patients we have identified as experiencing a death as actually alive; however, if at some later date than a member’s confirmation the patient is verified dead in the external data sources, this verified death will override the previous “alive” status as they could have died more recently than what the member was just reported. UNOS is working on the best approach to identify how often false positives from externally verified sources have been included in the OPTN database historically.

UNOS and SRTR are reviewing current processes for death verification to ensure alignment of data and information available moving forward. Additional discussions on this point will be ongoing to review current discrepancies and a unified approach for consistency.

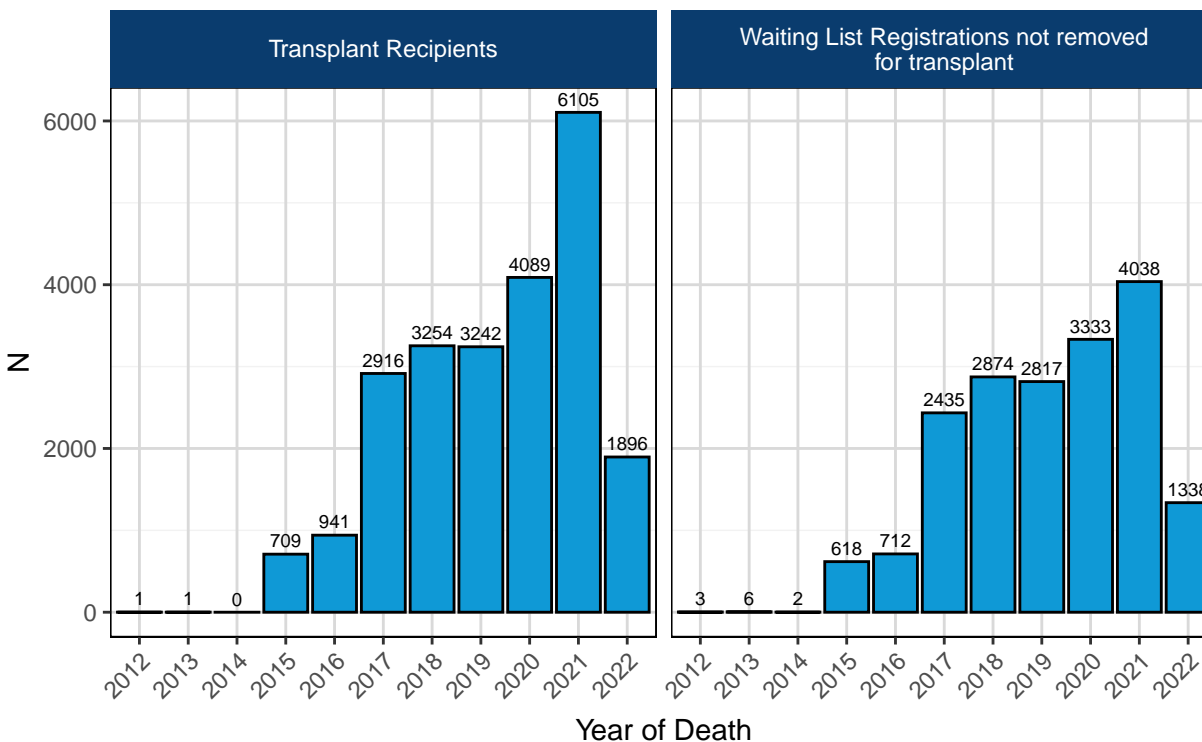

The remainder of the report is set up as follows - the Results Section entitled “New Deaths Externally Verified in February/March 2022” enumerates the bolus of deaths added to the OPTN data with the early 2022 enhancements to the obituary verification process. This is further broken up to characterize transplant recipients separately from waitlist registrations (not removed for transplant). As outlined above in the Data and Methods Section, if a waitlist registration has a removal associated with transplant they were excluded in this subgroup, with the assumption that they will be captured in the transplant recipients subgroup to avoid multiplicity. The Results Section entitled “Deaths with Death Date between 1/1/2005 - 12/31/2021” is also broken up into transplant recipients, waitlist registrations (not removed for transplant), as well as an additional all waitlist registrations group. These subsections characterize deaths with death dates between 2005 and 2021 by the source of death information in addition to other characteristics.

## New Deaths Externally Verified in February/March 2022

Figure 2 illustrates the distribution of the externally verified deaths from changes to the external verification process as of March 2022 by patient type and year of death. These deaths occurred during 2015 through 2022 for both transplant recipients and waitlist registrations (not removed for transplant).

Figure 2: External validation deaths from March 2022 by patient type and year of death.

### Transplant Recipients

Because there were very few deaths for heart-lung and intestine transplant recipients with the updated external verification process, these organs will be excluded in the graphics and tables in the rest of this section.

Table 1: External validation deaths for transplant recipients from March 2022 by organ.

Organ	N
Heart	1070
Heart-Lung	4
Intestine	15
Kidney	17744
Kidney-Pancreas	969
Liver	2782
Lung	291
Pancreas	279
TOTAL	23154

The order of magnitude is much larger for kidney and overall deaths each year, so the bottom panel of Figure 3 excludes these lines to provide a closer look at trends in other organs by year transplanted. There is a larger proportion of deaths that were capture from transplants around 2006, which aligns with the following figure illustrating time from transplant to death (Figure 4). The earliest Spring 2022 Program Specific Report (PSR) cohort began January 1, 2016 and the latest ended December 31, 2021. There were 3% (705) of these externally verified deaths from the enhanced process that had transplant dates from 2016 - 2021.

Figure 3: External validation deaths for transplant recipients from March 2022 by organ and year of transplant. Top panel contains all organs and total, bottom panel excludes kidney and total trends.

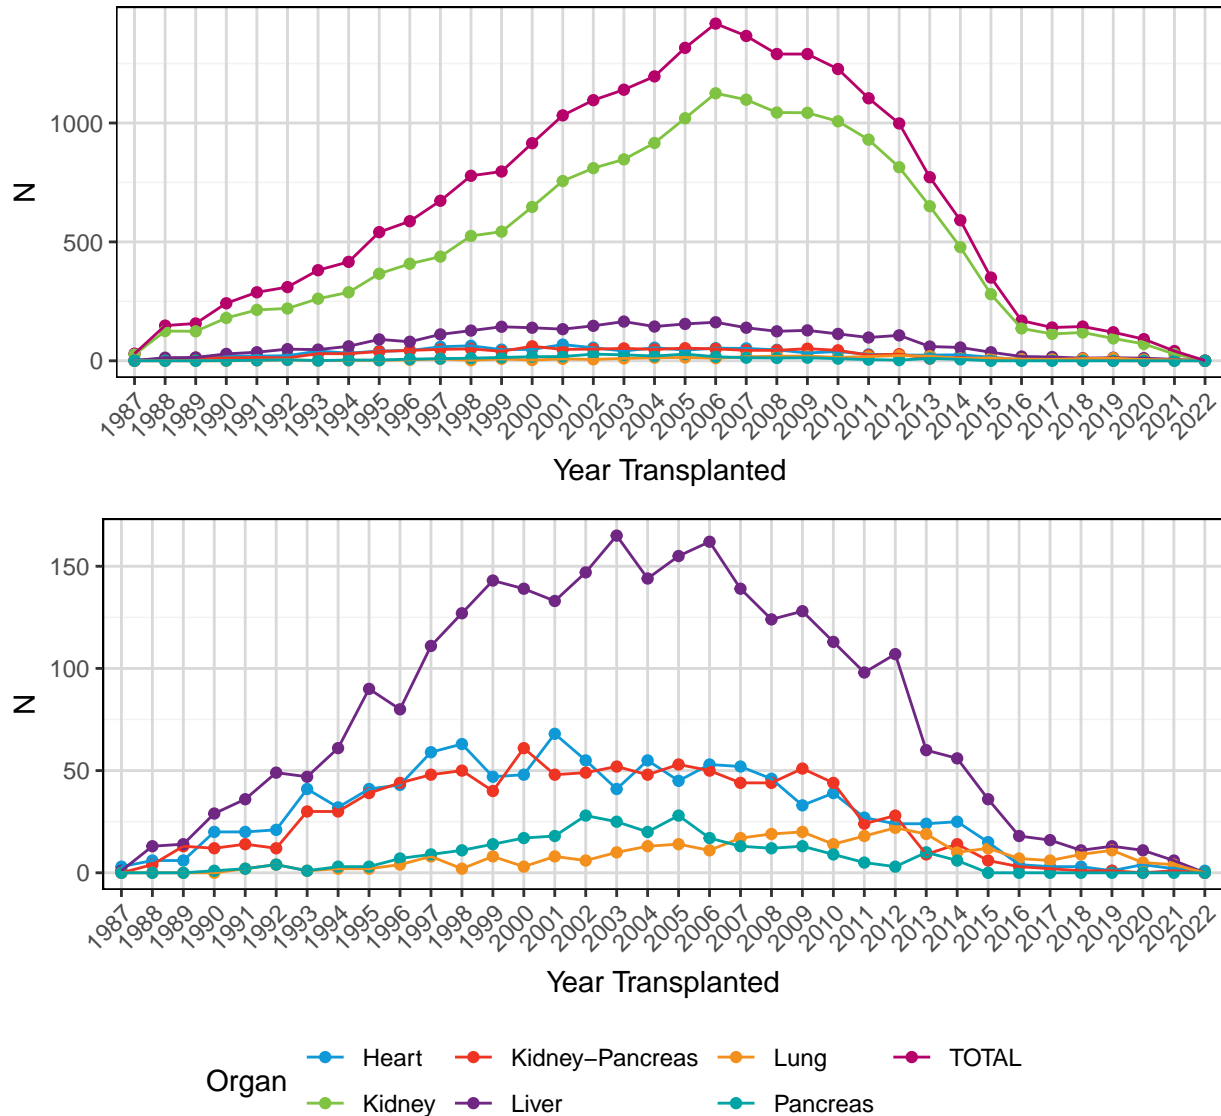

Table 2: External validation deaths for transplant recipients from March 2022 by organ and year of transplant.

Year Transplanted	Heart	Kidney	Kidney-Pancreas	Liver	Lung	Pancreas	TOTAL
1987	*	26	*	*	*	*	30
1988	*	125	*	13	*	*	148
1989	*	124	13	14	*	*	157
1990	20	180	12	29	*	*	242
1991	20	214	14	36	*	*	288
1992	21	220	12	49	*	*	310
1993	41	261	30	47	*	*	381
1994	32	288	30	61	*	*	416

\* Counts less than 10 not shown.

Across organs, the majority of transplant recipients in the externally validated deaths occurred as deaths after lost to follow-up. Over half of pancreas and close to one third of kidney transplant recipient externally validated deaths occurred as deaths after graft failure.

Figure 5: External validation deaths for transplant recipients from March 2022 by organ and follow-up status at death.

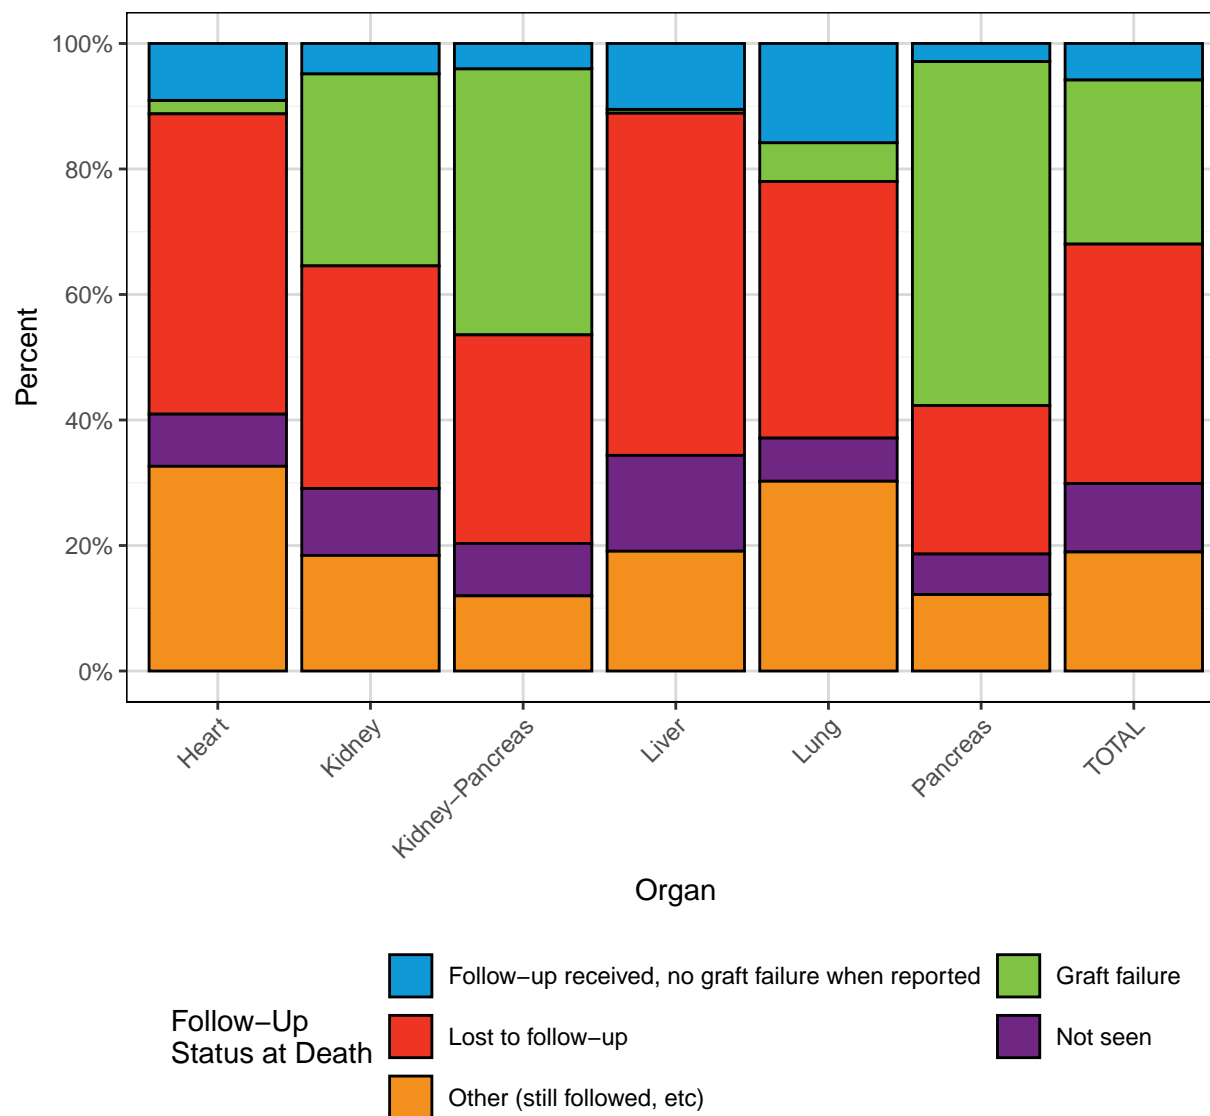

Table 4: External validation deaths for transplant recipients from March 2022 by organ and follow-up status at death.

Follow-Up Status at Death	Heart		Kidney		Kidney-Pancreas		Liver		Lung		Pancreas		TOTAL

For kidney transplant recipients, 25% of these externally validated deaths were Black, Non-Hispanic. This was followed by 13% Hispanic-Latino transplant recipients. Black transplant recipients made up 14% and 10% of these kidney-pancreas and heart externally validated deaths, respectively. Hispanic/Latino transplant recipients made up 11% of these liver externally validated deaths.

Heart, liver, lung, and pancreas transplant recipients in these externally validated deaths were more often private insurance holders, whereas public insurance was more common for the kidney and kidney-pancreas transplant recipient externally validated deaths. For heart, there was a larger (13%) proportion of unknown or not reported insurance status.

Figure 10: External validation deaths for transplant recipients from March 2022 by organ and recipient primary source of payment at transplant.

The top states where transplant recipients received transplants in these externally validated deaths were similar for heart, kidney, kidney-pancreas, and liver. Overall, California, Texas, Florida, Pennsylvania, and New York transplant center states had the largest volumes.

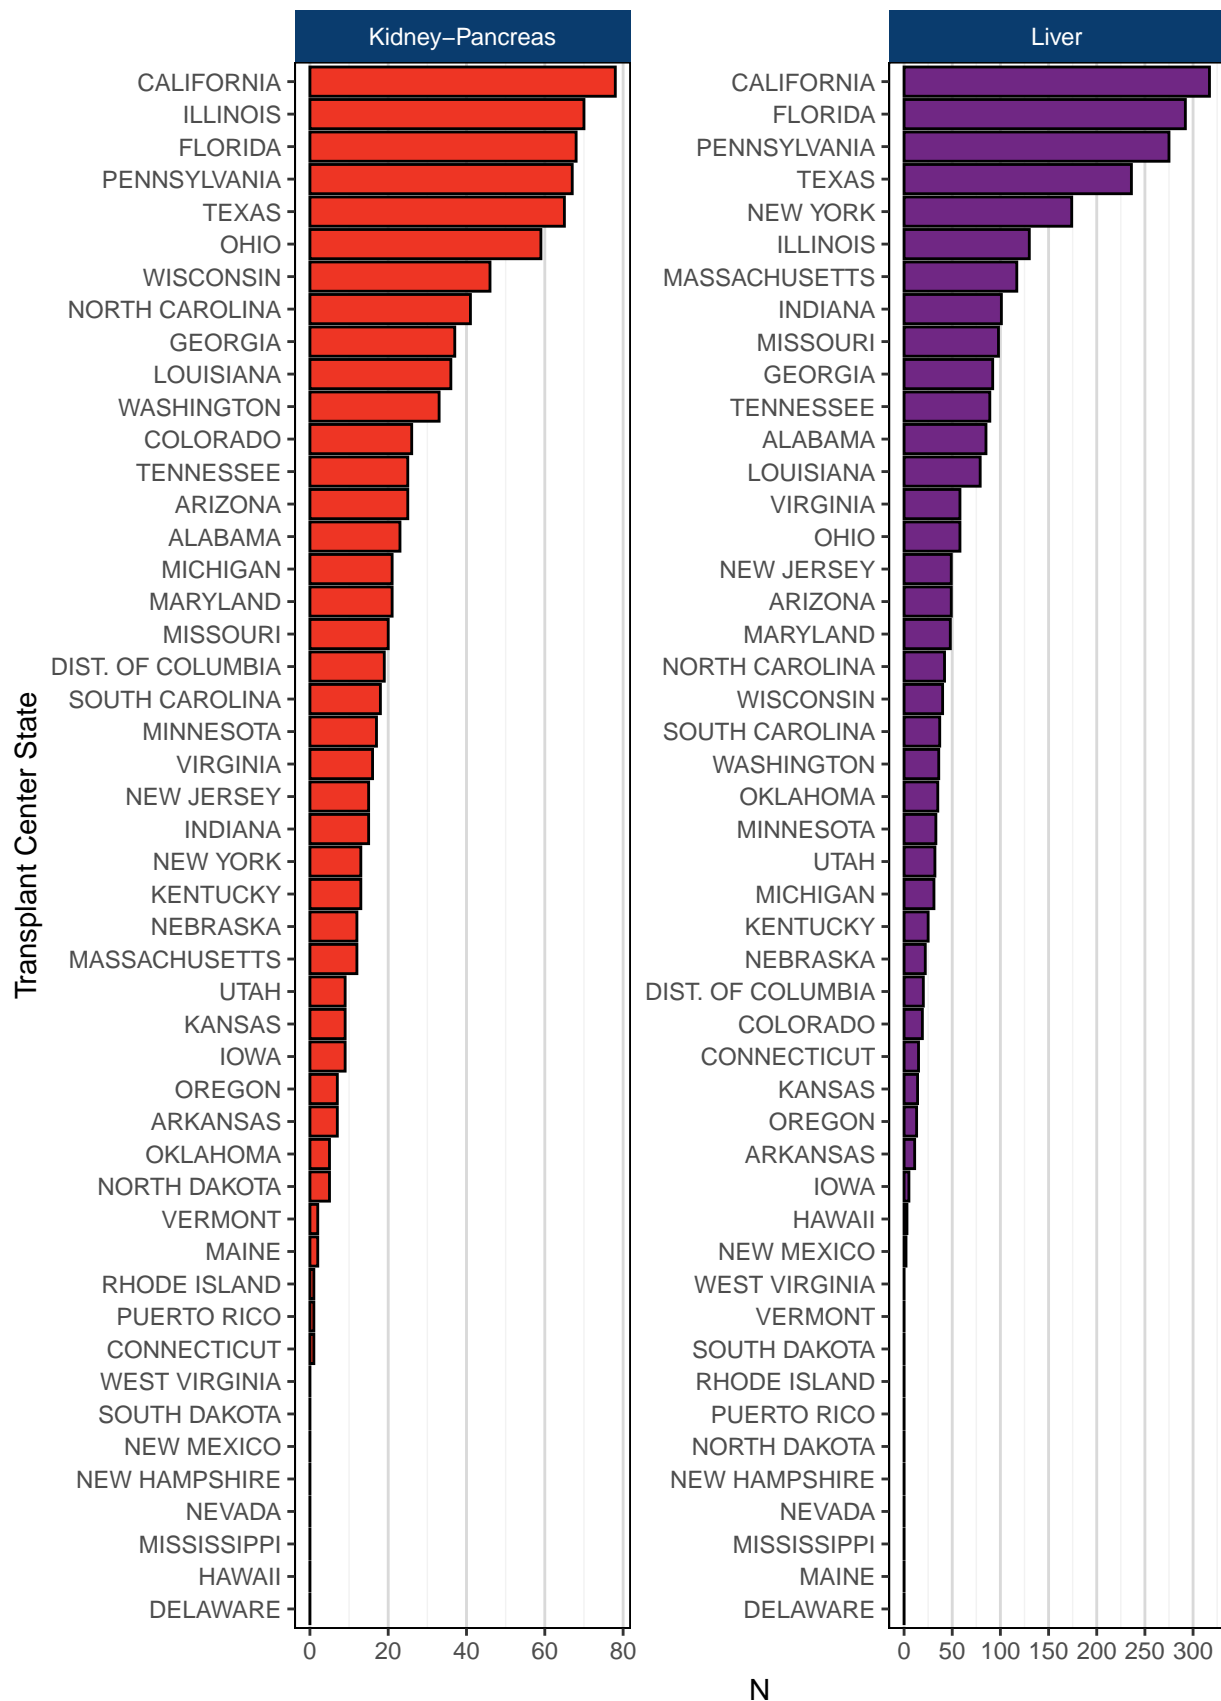

The table below provides a summary of the distribution of these externally validated deaths across transplant center states by organ.

Table 10: Summary of number of external validation deaths for transplant recipients from March 2022 per transplant center state by organ. Transplant center states for each organ type included if at least one death.

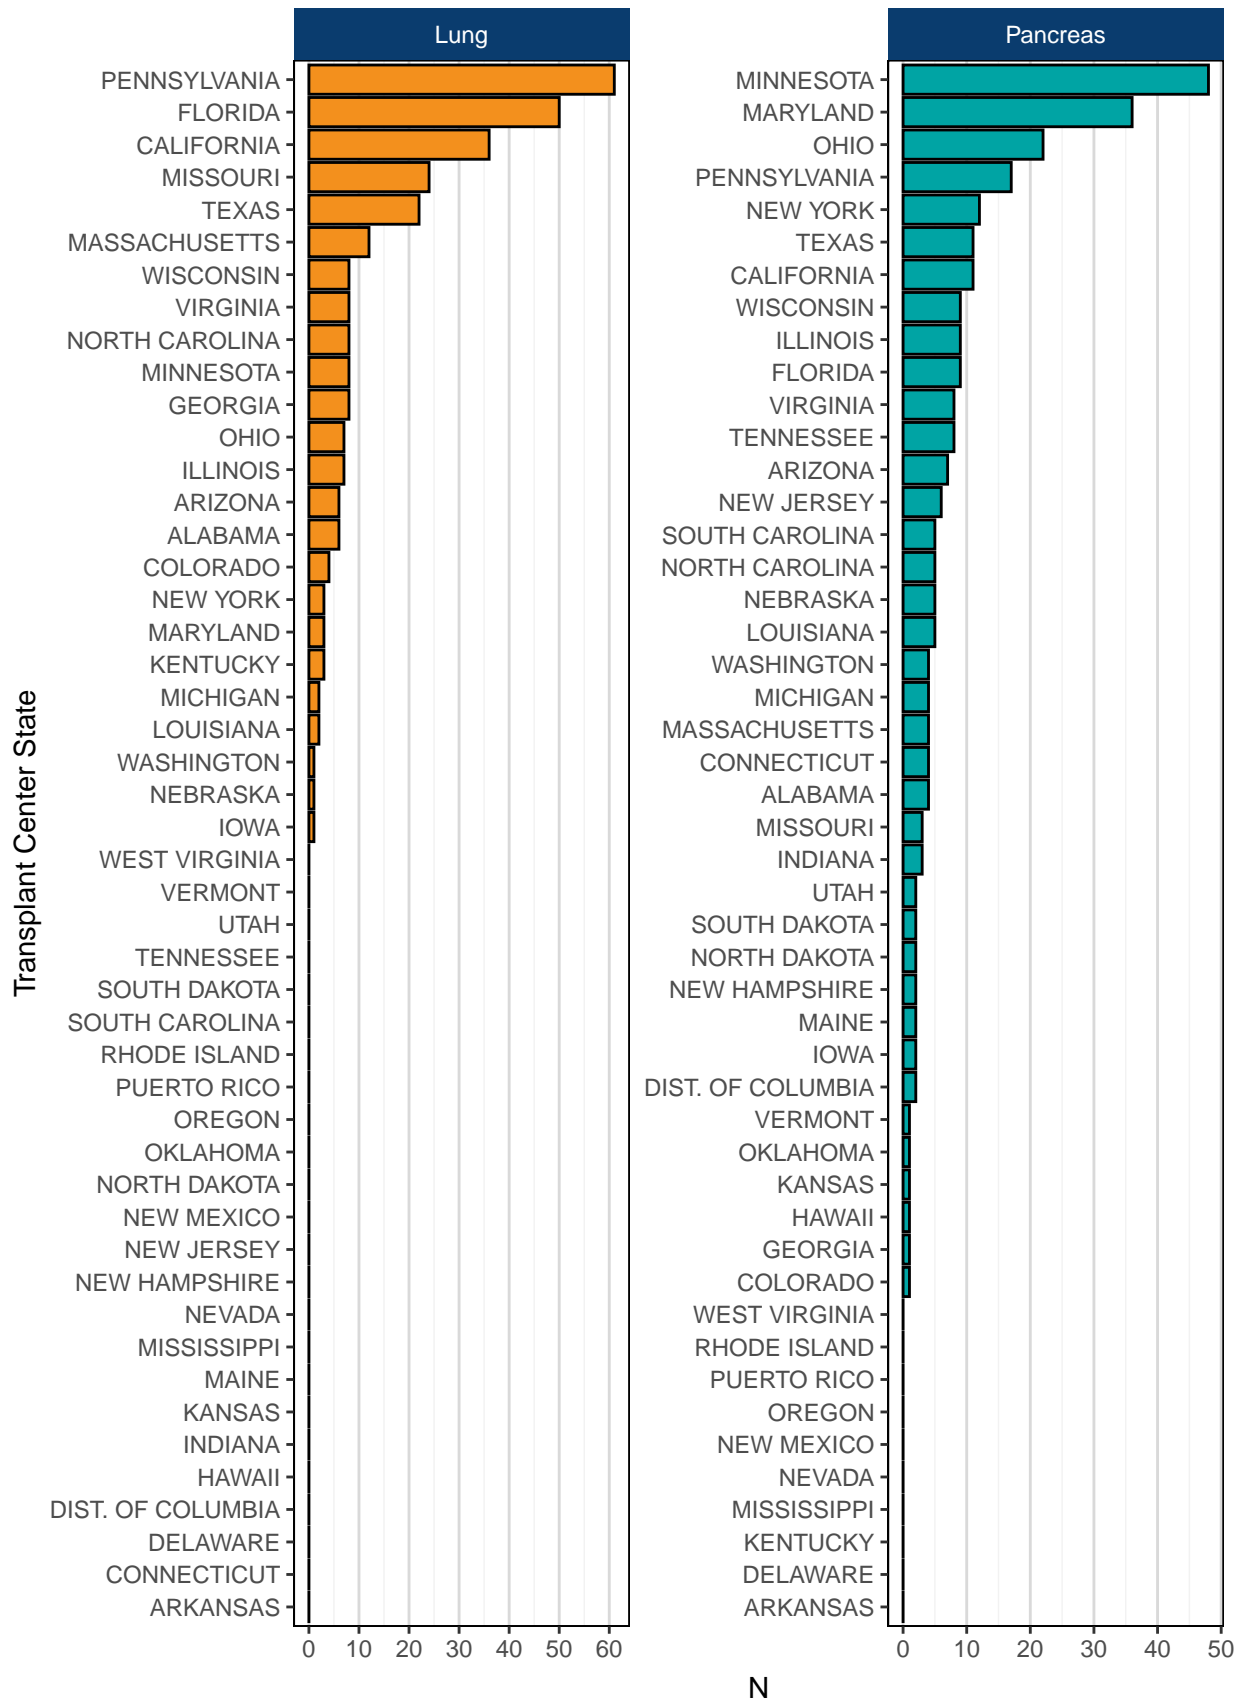

Organ	Mimimum	25th Percentile	Mean	Median	75th Percentile	Maximum
Heart	2	9.00	28.2	17.0	32.75	121
Kidney	6	91.75	369.7	277.0	477.25	1683

TOTAL	1	8.75	76.2	43.5	102.25	617

Figure 12: External validation deaths for transplant recipients from March 2022 by organ and recipient transplant center.

**Waitlist Registrations, Not Removed for Transplant**

Because there were very few deaths for heart-lung and intestine transplant recipients with the updated external verification process, these organs are excluded in the graphics and tables in the rest of this section.

Table 12: External validation deaths for waitlist registrations not removed for transplant from March 2022 by organ.

Organ	N
Heart	1042
Heart-Lung	19
Intestine	10
Kidney	12958
Kidney-Pancreas	333
Liver	2896
Lung	501
Pancreas	417
TOTAL	18176

The order of magnitude is much larger for kidney and overall deaths each year, so the bottom panel of Figure 13 excludes these lines to provide a closer look at trends in other organs by year transplanted. There is a larger proportion of deaths that were captured from waitlist registrations removed around 2015. The earliest Spring 2022 Program Specific Report (PSR) cohort began January 1, 2016 and the latest ended December 31, 2021. There were 25% (4,636) of these externally verified deaths from the enhanced process that were removed from the waitlist during 2016 - 2021, with 8% occurring in 2016 and decreasing volumes each additional year.

Figure 13: External validation deaths for waitlist registrations not removed for transplant from March 2022 by organ and time from transplant to death. Top panel contains all organs and total, bottom panel excludes kidney and total trends.

For kidney, kidney-pancreas, and pancreas waitlist registrations, removals for “Other” (includes Other, Candidate removed in error, Candidate listed for unacceptable antigens only, Candidate listed in error, Transferred to another center) make up the majority of reasons for removal followed by “Candidate condition deteriorated, too sick to transplant” in these externally validated deaths. For heart, liver, and lung waitlist registrations, removal for “Candidate condition improved, transplant not needed” accounted for the largest proportion followed by “Other” and “Candidate condition deteriorated, too sick to transplant”.

Figure 15: External validation deaths for waitlist registrations not removed for transplant from March 2022 by organ and removal reason.

Heart, liver, and lung waitlist registrations in these externally validated deaths were more often private insurance holders, whereas public insurance was more common for the kidney, kidney-pancreas, and pancreas waitlist registration externally validated deaths. For heart and pancreas waitlist registrations, there were larger proportions of unknown or not reported insurance status, at 10 and 11%, respectively.

Figure 20: External validation deaths for waitlist registrations not removed for transplant from March 2022 by organ and candidate primary source of payment at listing.

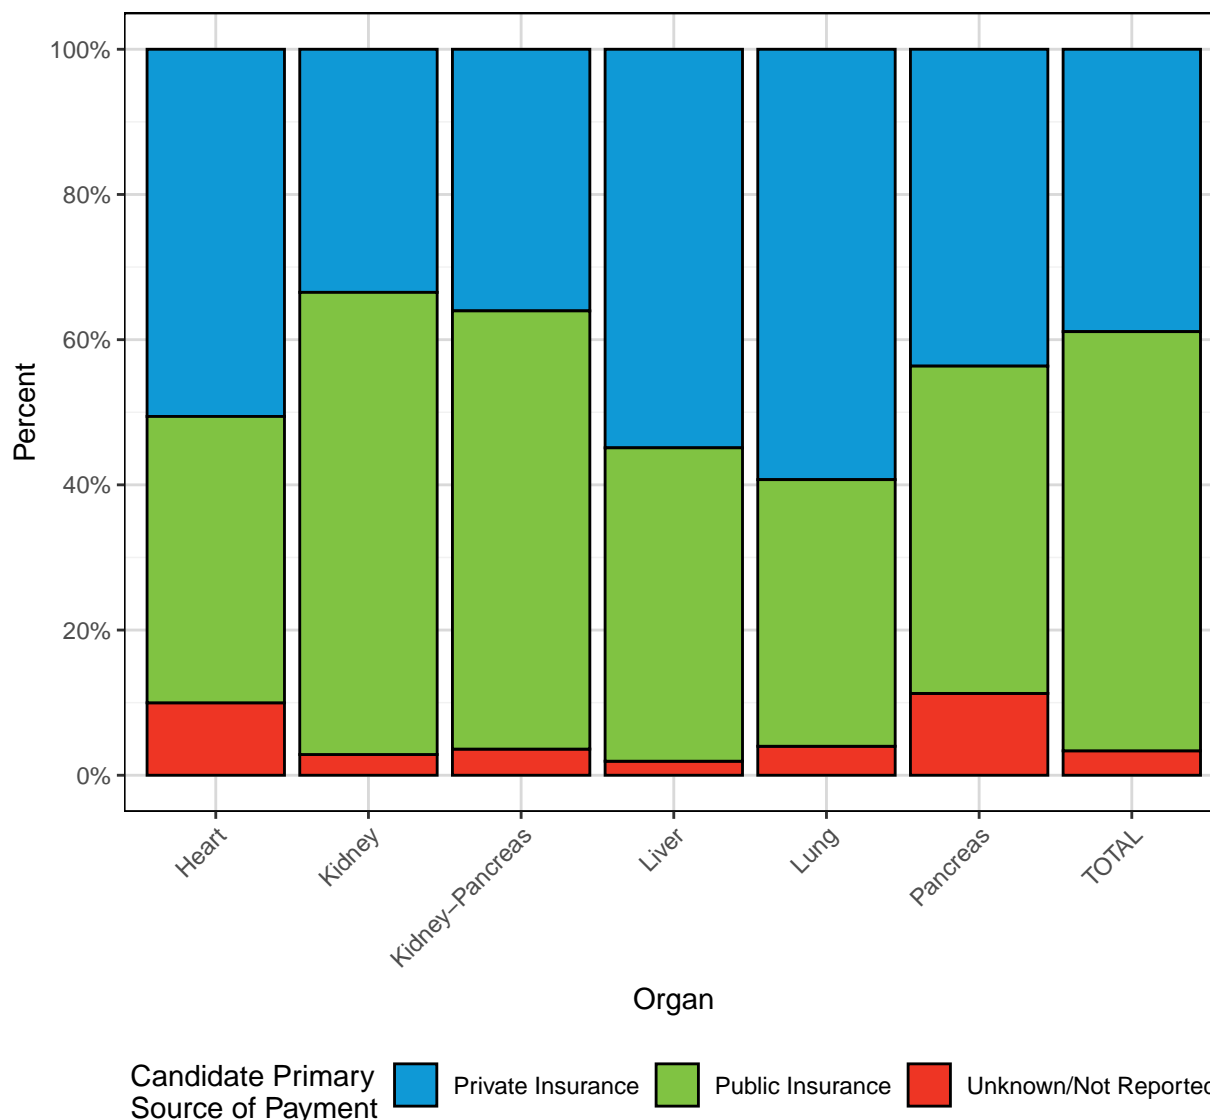

Table 20: External validation deaths for waitlist registrations not removed for transplant from March 2022 by organ and candidate primary source of payment at listing.

The top states where waitlist registrations were listed in these externally validated deaths slightly varied by organ. Overall, California, Texas, Pennsylvania, New York, and Illinois listing center states had the largest volumes. The table below provides a summary of the distribution of these externally validated deaths across listing center states by organ.

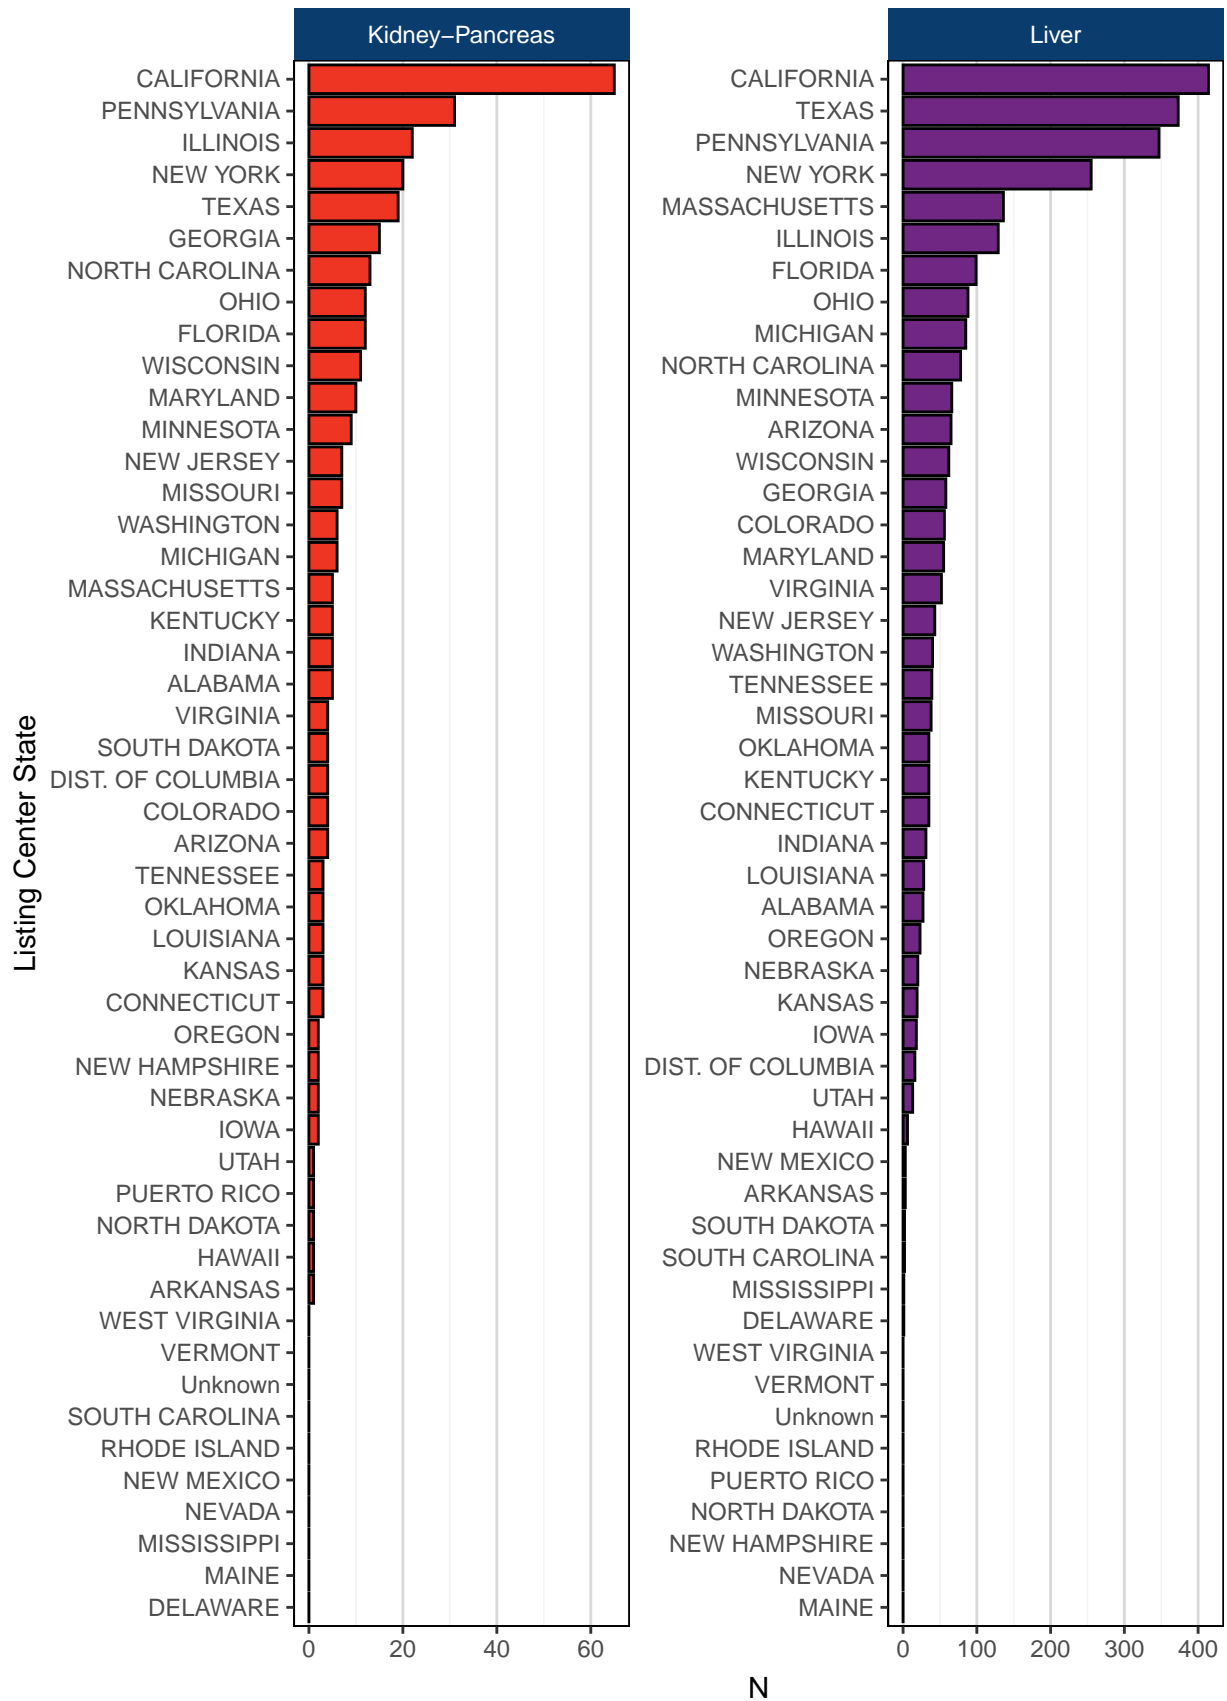

Table 21: Summary of number of external validation deaths for waitlist registrations not removed for transplant from March 2022 per listing center state by organ. Listing center states for each organ type included if at least one death.

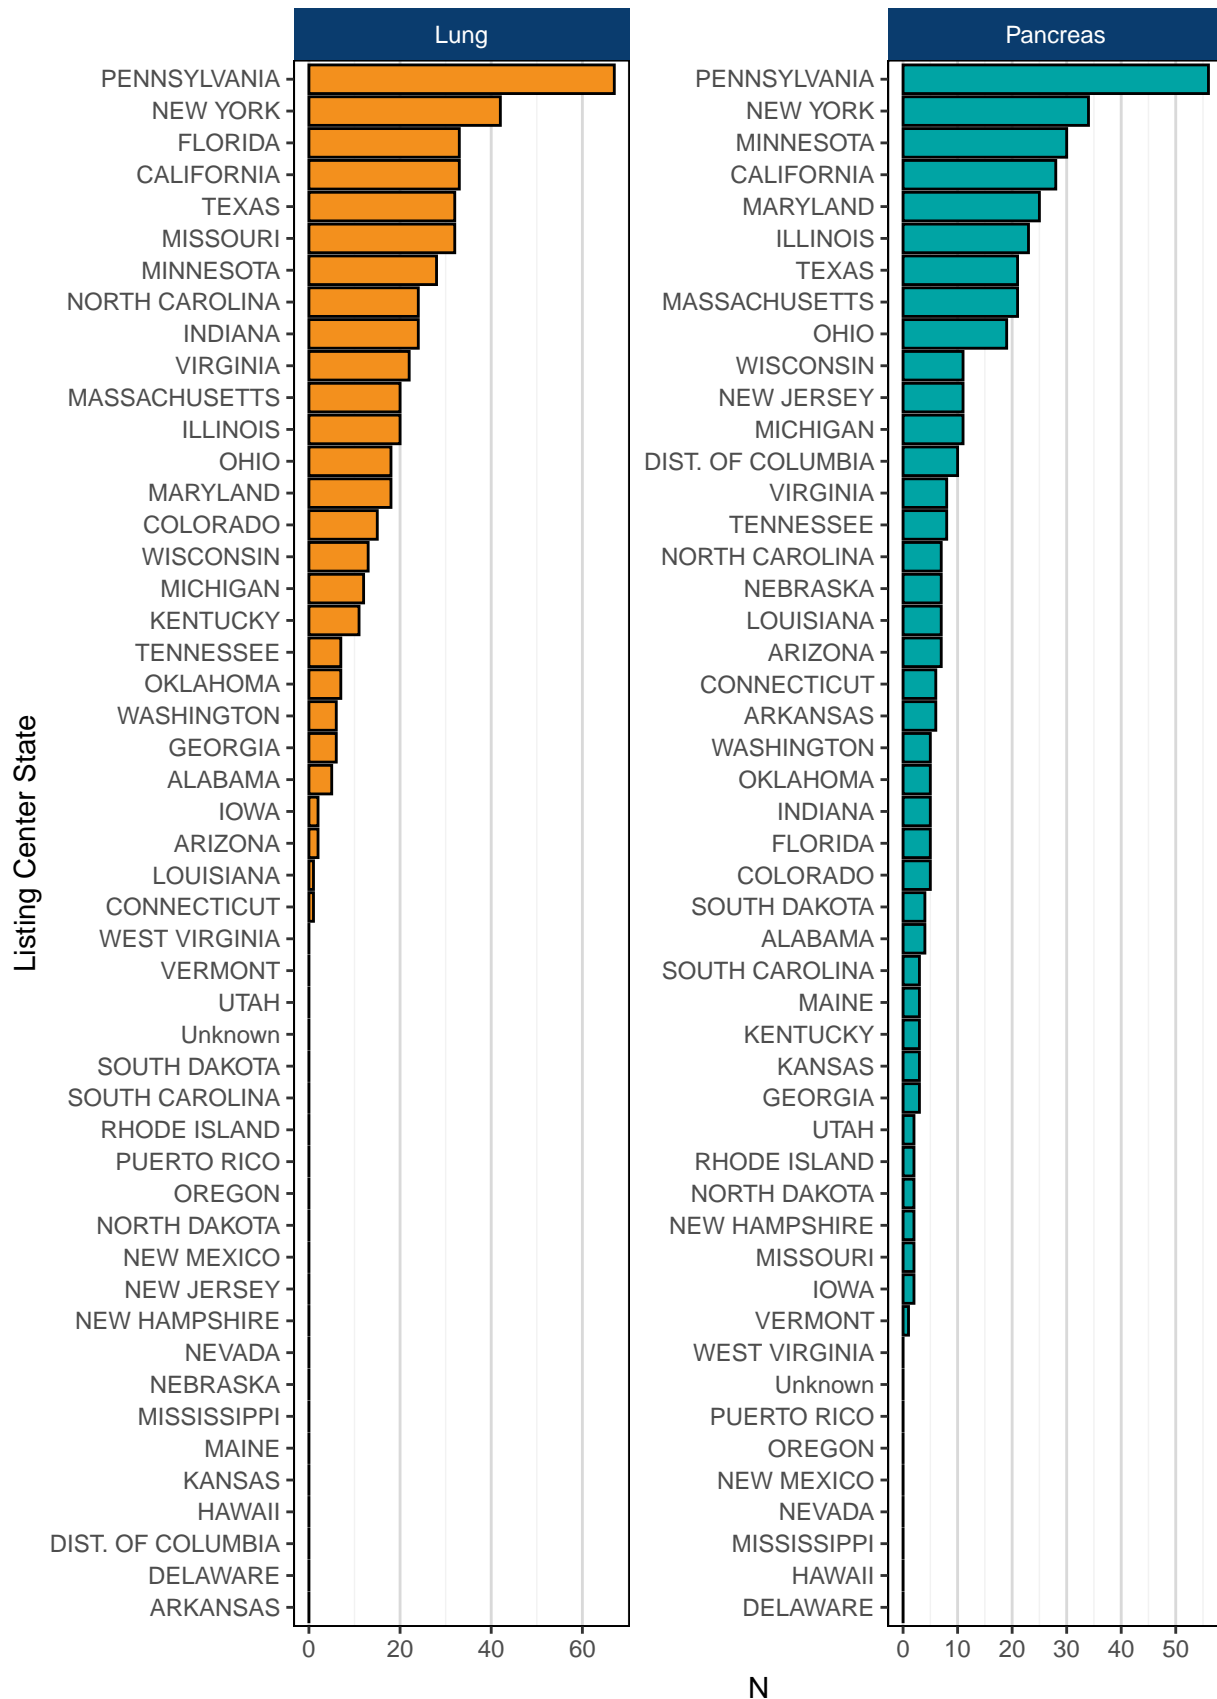

Organ	Mimimum	25th Percentile	Mean	Median	75th Percentile	Maximum
Heart	1	11.75	27.4	20.5	34.75	98
Kidney	12	51.75	270.0	152.0	377.75	1725

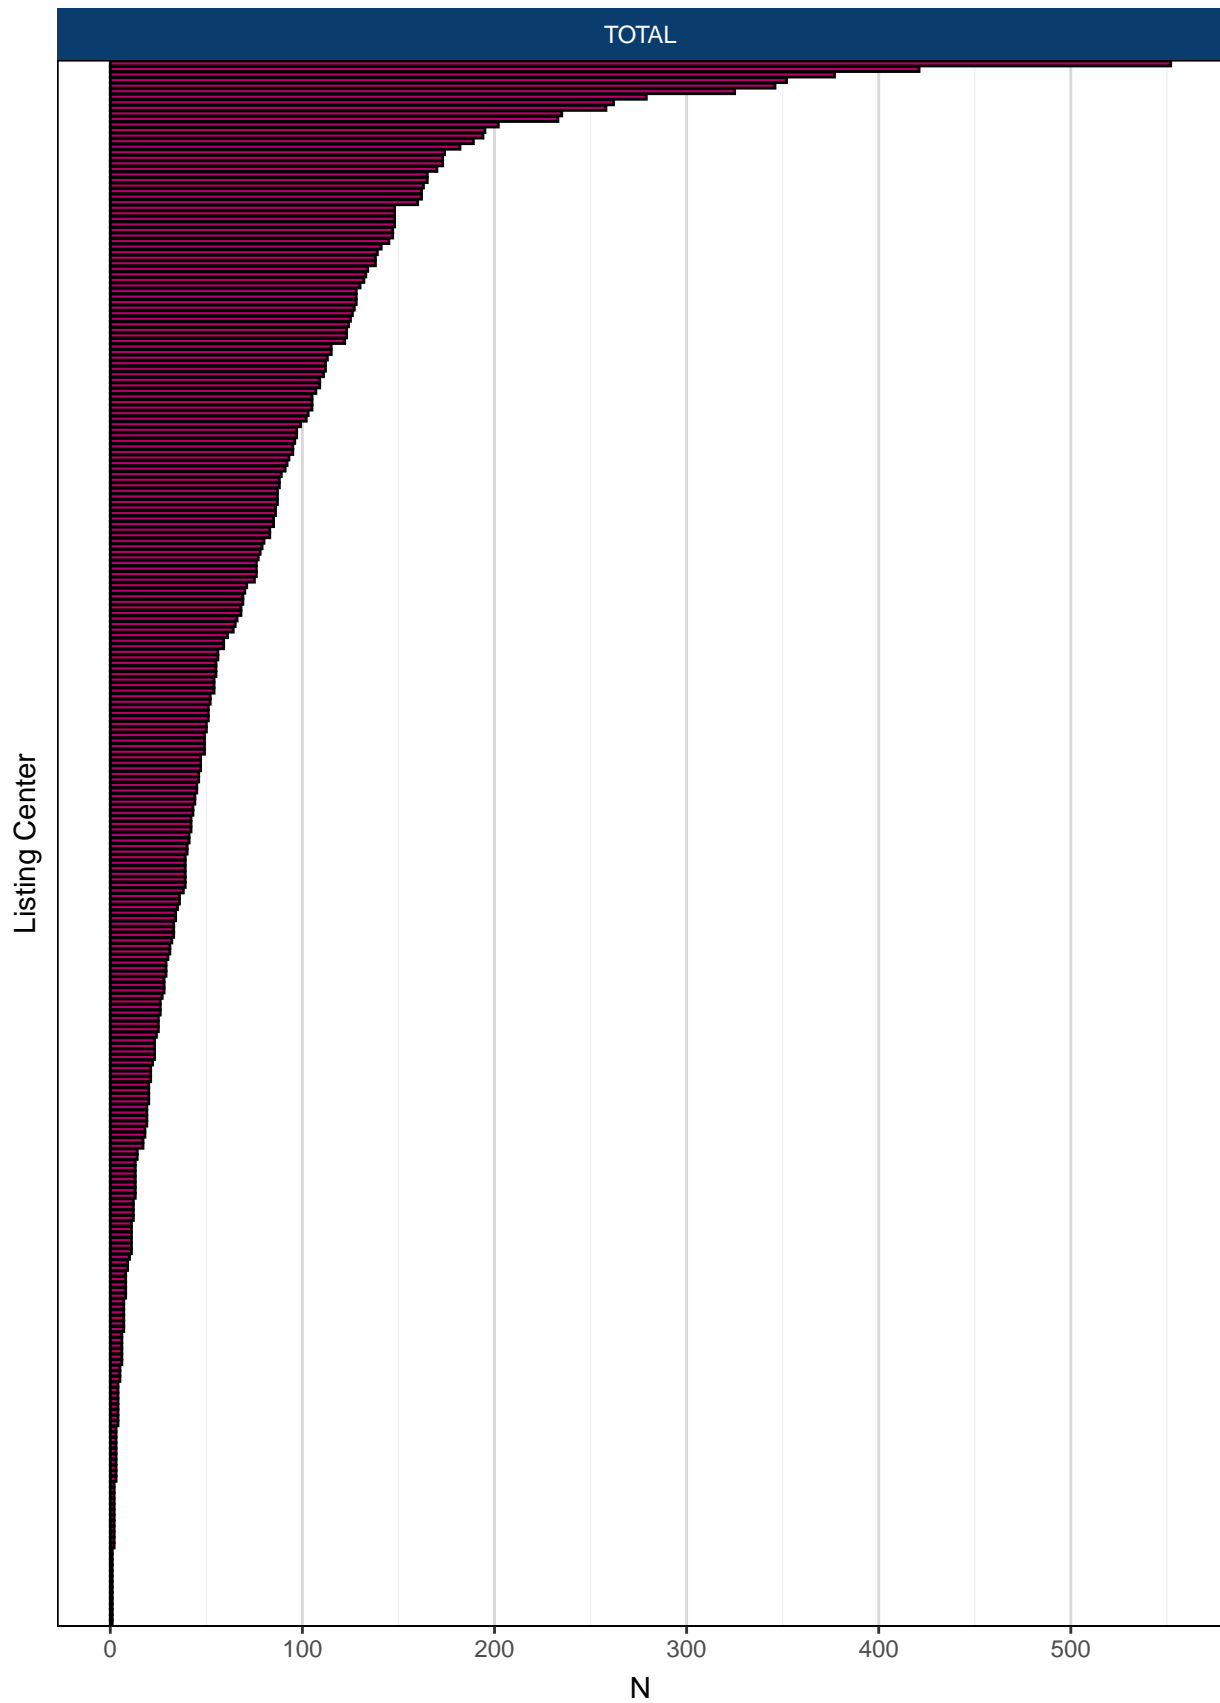

Figure 22: External validation deaths for waitlist registrations not removed for transplant from March 2022 by organ and candidate listing center.

### Deaths with Death Date between January 1, 2005 and December 31, 2021

Figure 23 illustrates all transplant recipient and waitlist registration (not removed for transplant) deaths that occurred between January 1, 2005 through December 31, 2021 by source of death information. Externally verified deaths begin accounting for a proportion of deaths information each year starting in 2012, when the external verification process was put in place.

By year, smaller proportions of transplant recipient deaths are externally validated or unverified compared to waitlist registration deaths. For both patient types, there are increased proportions of unverified deaths in the most recent three years. Over time, many externally verified and unverified deaths for transplant recipients are subsequently reported by OPTN members as follow-up visits occur.

The Relaxation of Data Submission Requirements was approved as an emergency action, effective March 13, 2020 through July 1, 2021 for Transplant Recipient Follow-Up Forms (TRF), Living Donor Follow-Up (LDF) forms, and Post-Transplant Malignancy (PTM) forms. This may have impacted the level of reporting from OPTN members during this time frame.

Figure 23: Deaths during January 1, 2005 - December 31, 2021 by patient type, year of death, and source of death information.

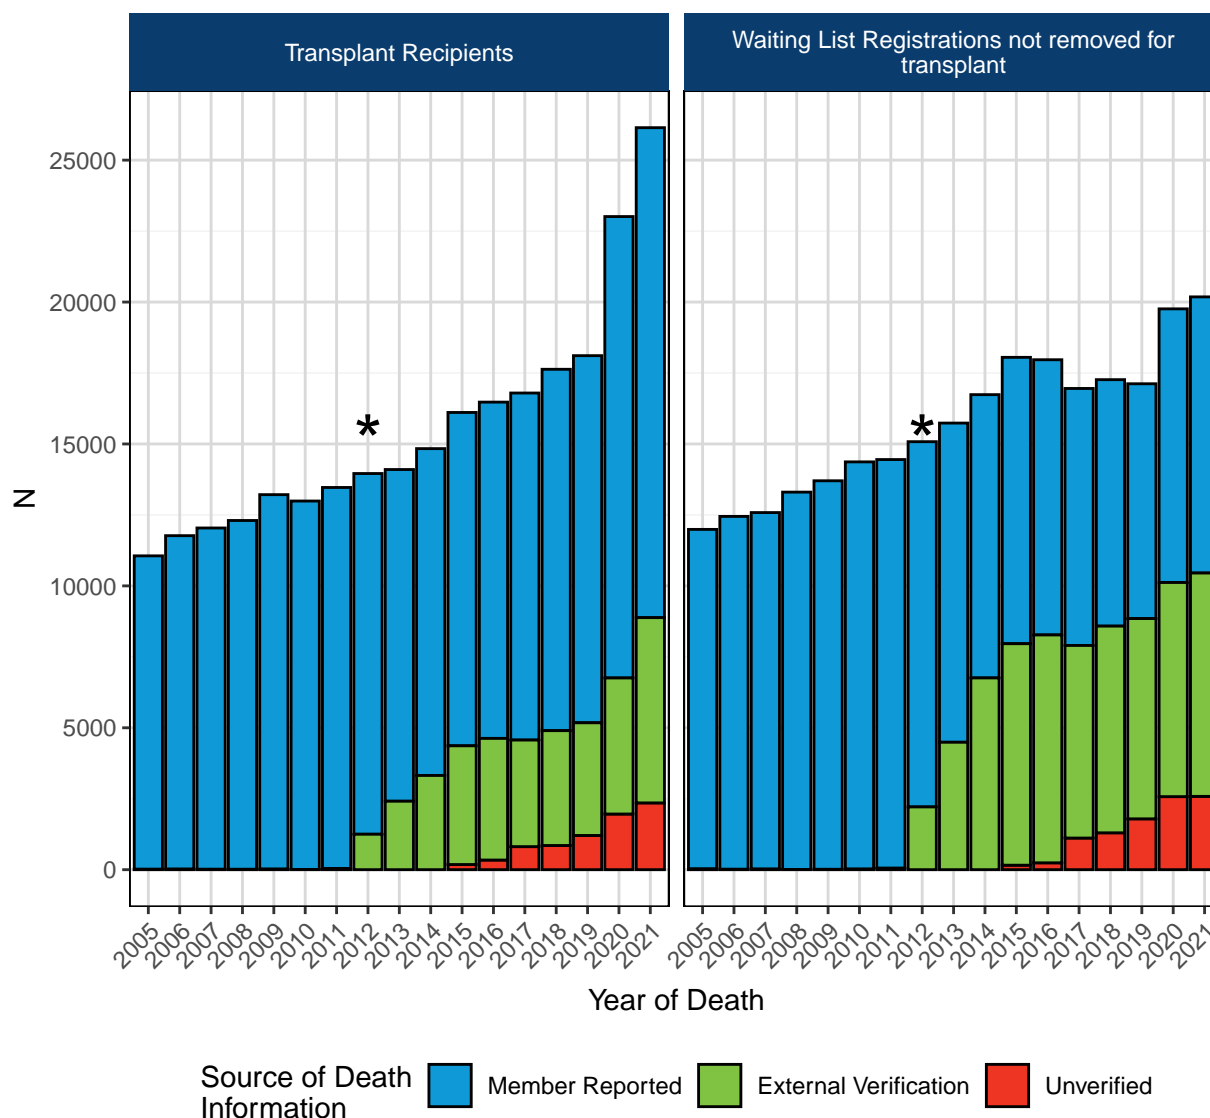

Table 23: Deaths during January 1, 2005 - December 31, 2021 by patient type, year of death, and source of death information.

2019	8273	48.3%	7057	41.2%	1791	10.5%
2020	9641	48.8%	7545	38.2%	2574	13.0%
2021	9730	48.2%	7870	39.0%	2582	12.8%

Overall, 77.5% of deaths during this time period came from OPTN member-reported sources, while 19.1% of deaths came from externally verified sources and 3.4% remain unverified and are not included in the OPTN database.

As a reminder, source of death information may change over time. Notably, a death may originally be picked up through an external validation death source and later be reported by the OPTN member. This death would then no longer fall under the “External Verification” category and would fall under the “Member Reported” category from then on.

Table 24: Deaths during January 1, 2005 - December 31, 2021 by source of death information.

Source of Death Information	N	%

<b>External Verification</b>		
LexisNexis Data	20861	3.66
CMS Data	32953	5.78
Obituary Data	55140	9.67
<b>Unverified</b>		
Unverified	19458	3.41

### Transplant Recipients

Because there were few deaths for heart-lung and intestine transplant recipients from externally verified sources or unverified, these organs will be excluded in the graphics and tables in the rest of this section.

Table 25: Deaths for transplant recipients during January 1, 2005 - December 31, 2021 by organ and source of death information.

Organ	Member Reported		External Verification		Unverified	
	N	%	N	%	N	%
Heart	25464	94.0%	1335	4.9%	284	1.0%
Heart-Lung	424	98.4%	4	0.9%	3	0.7%
Intestine	1163	97.6%	24	2.0%	4	0.3%
Kidney	111449	74.9%	31356	21.1%	5934	4.0%
Kidney-Pancreas	6729	77.9%	1631	18.9%	279	3.2%
Liver	49409	91.5%	3501	6.5%	1072	2.0%
Lung	20331	98.0%	337	1.6%	69	0.3%
Pancreas	2663	83.0%	484	15.1%	62	1.9%
TOTAL	217632	82.4%	38672	14.6%	7707	2.9%

Similar trends were seen as to Figure 3 within each death source, though at much smaller magnitudes for externally verified and unverified deaths. The trends in Figure 24 again align with those in Figure 25 on time from transplant to death. Most deaths that were captured were for recipients 5-20 years post-transplant across organs for all death sources. Less than 10% of all externally verified and unverified deaths were for transplant recipients within 5 years of death. Corresponding table to Figure 24 in Appendix.

Figure 24: Deaths for transplant recipients during January 1, 2005 - December 31, 2021 by organ, year transplanted, and source of death information. Top panel contains all organs and total, bottom panel excludes kidney and total trends.

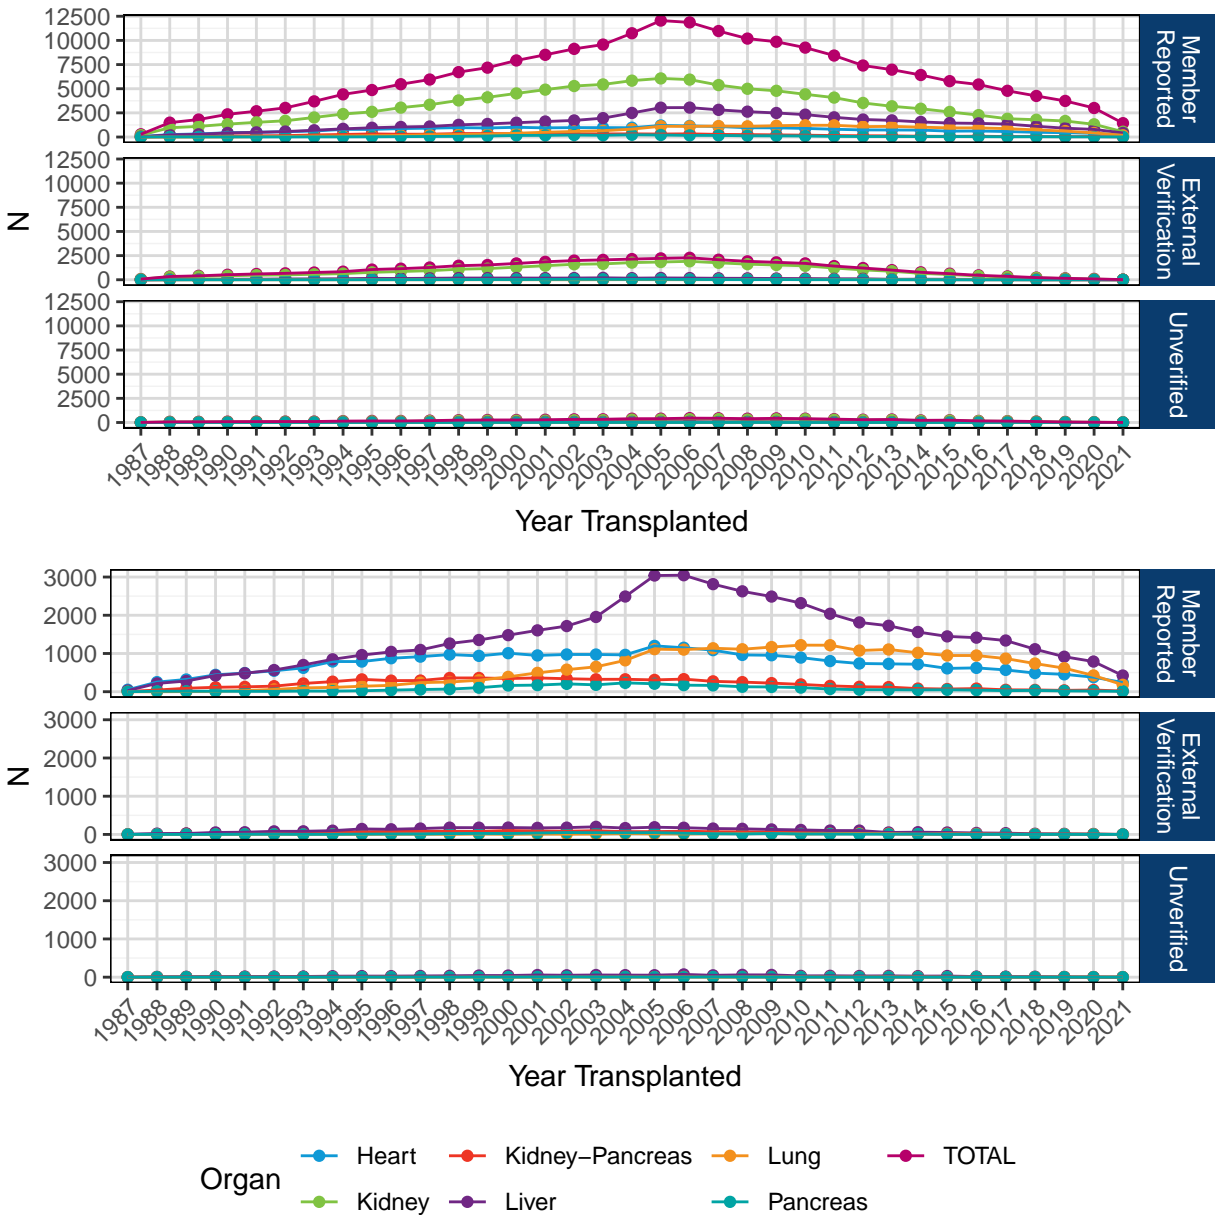

Figure 25: Deaths for transplant recipients during January 1, 2005 - December 31, 2021 by organ, time from transplant to death, and source of death information. Top panel contains all organs and total, bottom panel excludes kidney and total trends.

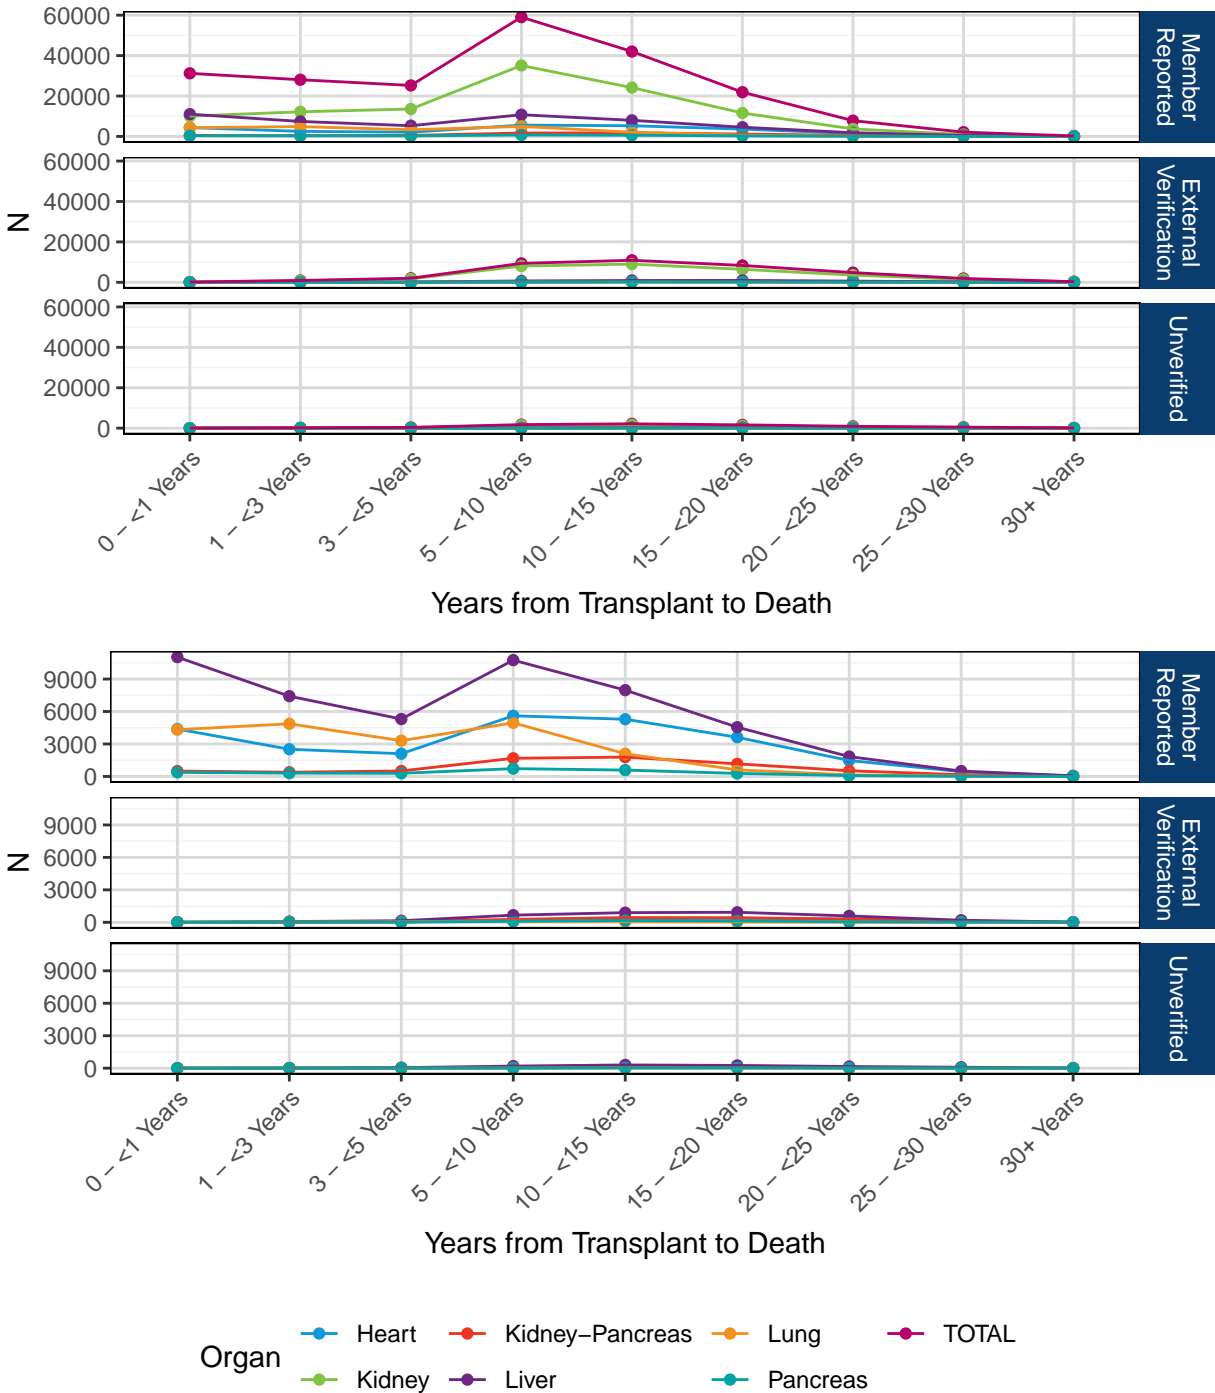

Table 26: Deaths for transplant recipients during January 1, 2005 - December 31, 2021 by organ, time from transplant to death, and source of death information.

\* Counts less than 10 not shown. Column percentages add to 100% within each organ.

For all organs except kidney-pancreas, the majority of member reported deaths occurred under the status of follow-up received without graft failure, meaning that the transplant center was continuing to follow-up post-transplant with the patients and able to report the death event prior to any graft failure event. However, the majority of externally verified deaths occurred under the status of death after lost to follow-up for heart, liver, and lung transplant recipients. The majority of externally verified deaths for kidney, kidney-pancreas, and pancreas transplant recipients occurred under the status of death after graft failure closely followed by lost to follow-up. The majority of unverified deaths for all organs except pancreas fell under death after lost to follow-up status.

Figure 26: Deaths for transplant recipients during January 1, 2005 - December 31, 2021 by organ, follow-up status at death, and source of death information.

\* Counts less than 10 not shown. Column percentages add to 100% within each organ.

The majority of kidney-pancreas and pancreas transplant recipients across all death sources were between ages 35-49 at time of transplant, while this was a bit older for all other organs across death sources, with ages 50-64 at time of transplant.

Overall, a higher proportion of externally verified deaths were Black, Non-Hispanic while a higher proportion of unverified deaths were Hispanic/Latino. This was true across most organs as well, though to a lesser degree for increased proportion of Black, Non-Hispanic externally verified deaths.

Most deaths across death sources for heart and liver transplant recipients were in the private insurance category, while the majority for kidney and kidney-pancreas transplant recipients had public insurance. For both lung and pancreas transplant recipients, the majority of member reported and externally verified deaths were in the private insurance category while unverified deaths were in the public insurance category.

Similarly, Table 34 provides a summary of the percentage of transplant recipient deaths per transplant center state from member reported, externally verified, or unverified sources of death information. This is given per state across each organ. For lung transplant recipients, a minimum of 95% of deaths are member reported across all states. On the other hand, no state had 100% of kidney transplant recipient deaths from member reported sources.

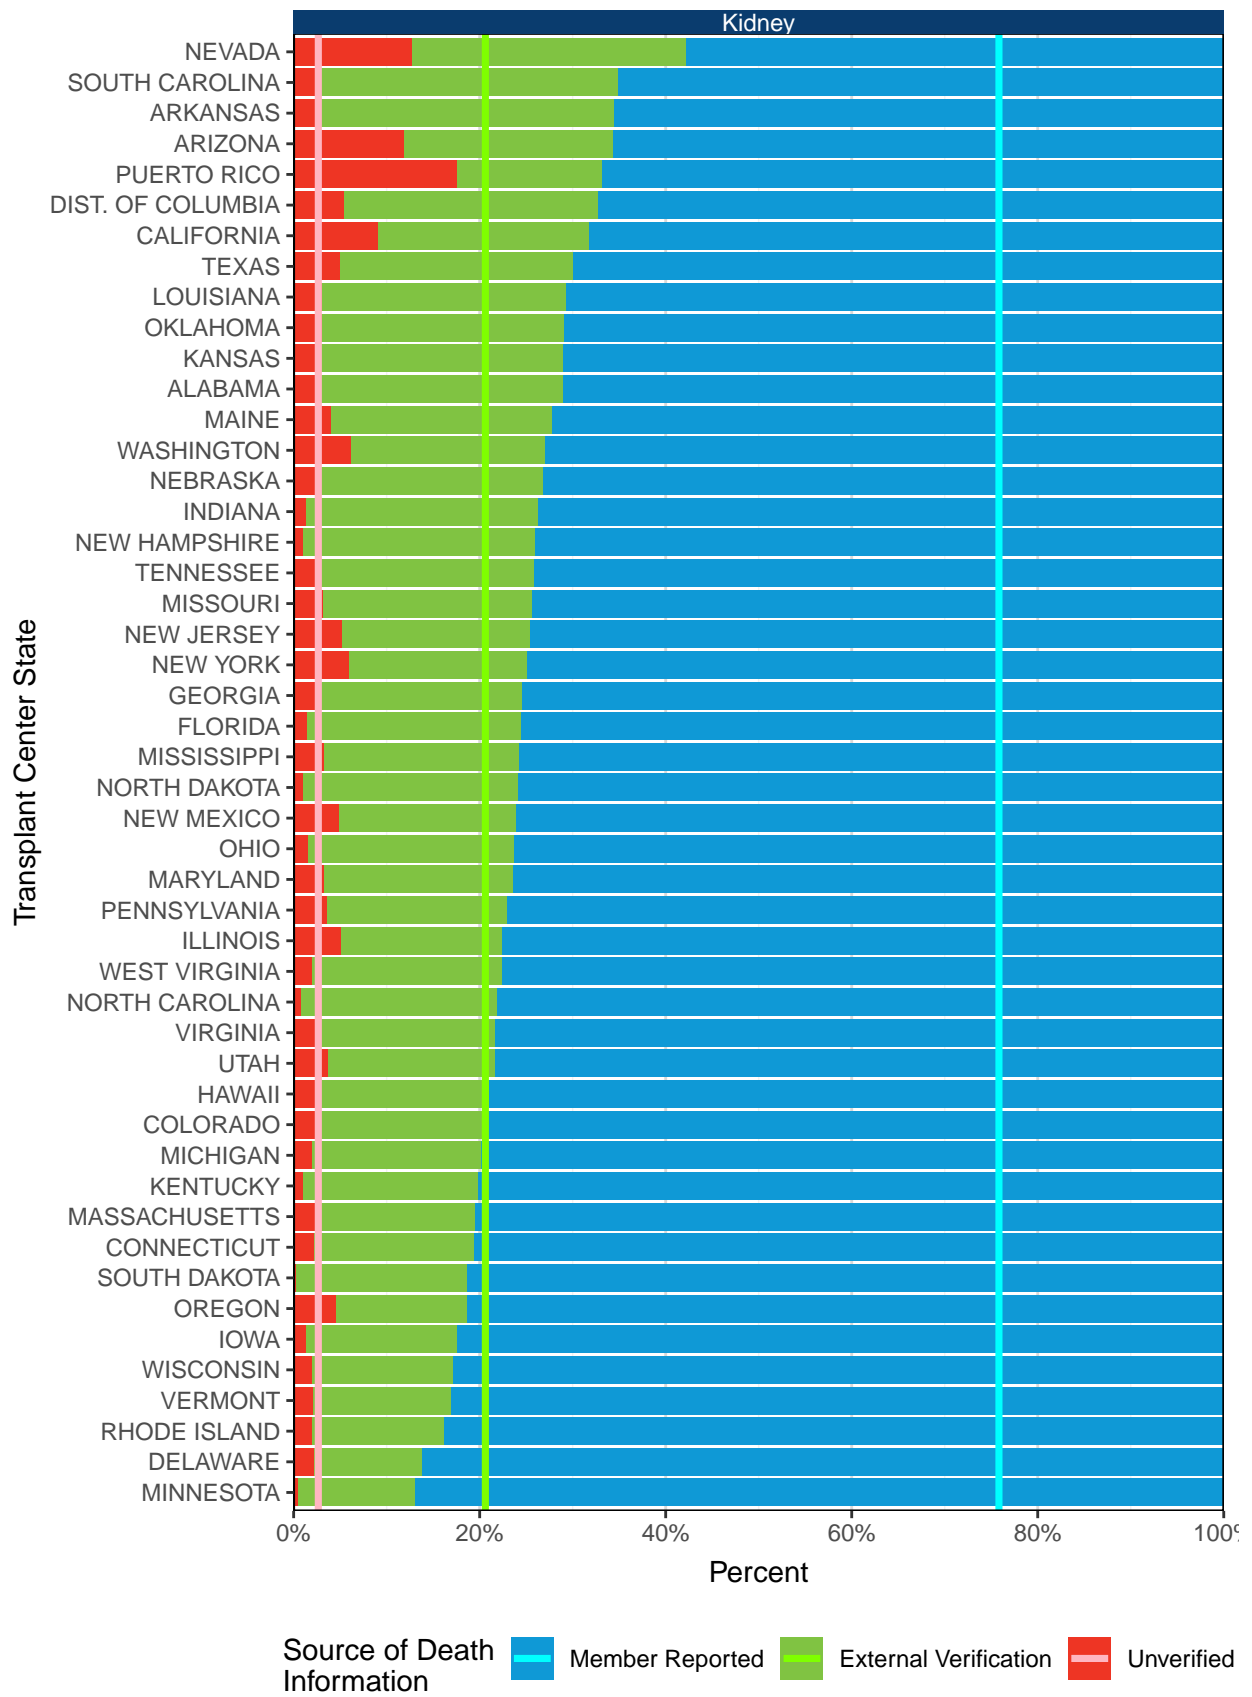

The following figures illustrate the distribution of percentages of source of death information per state for each organ.

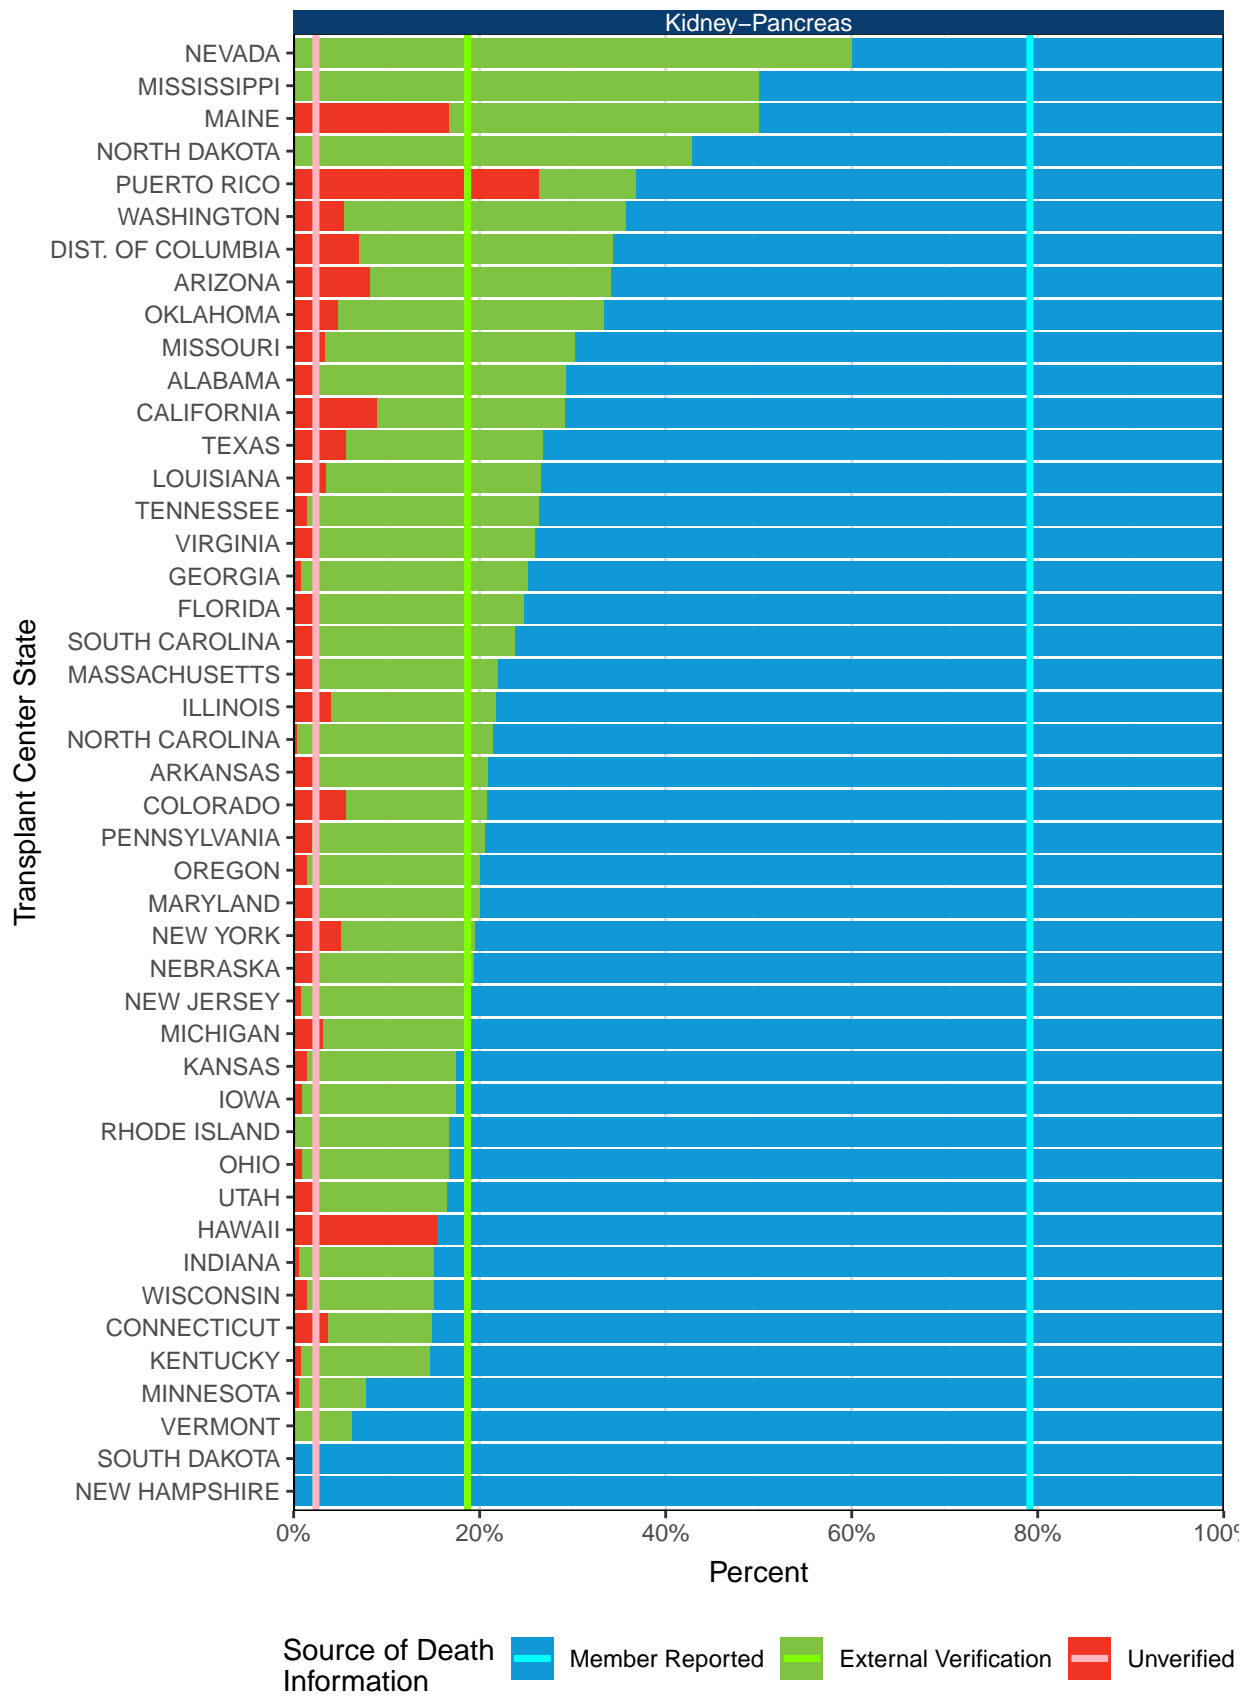

Table 34: Summary of percent of deaths for transplant recipients during January 1, 2005 - December 31, 2021 per recipient transplant center state by organ and source of death information. Recipient transplant center states for each organ type included if at least one death.

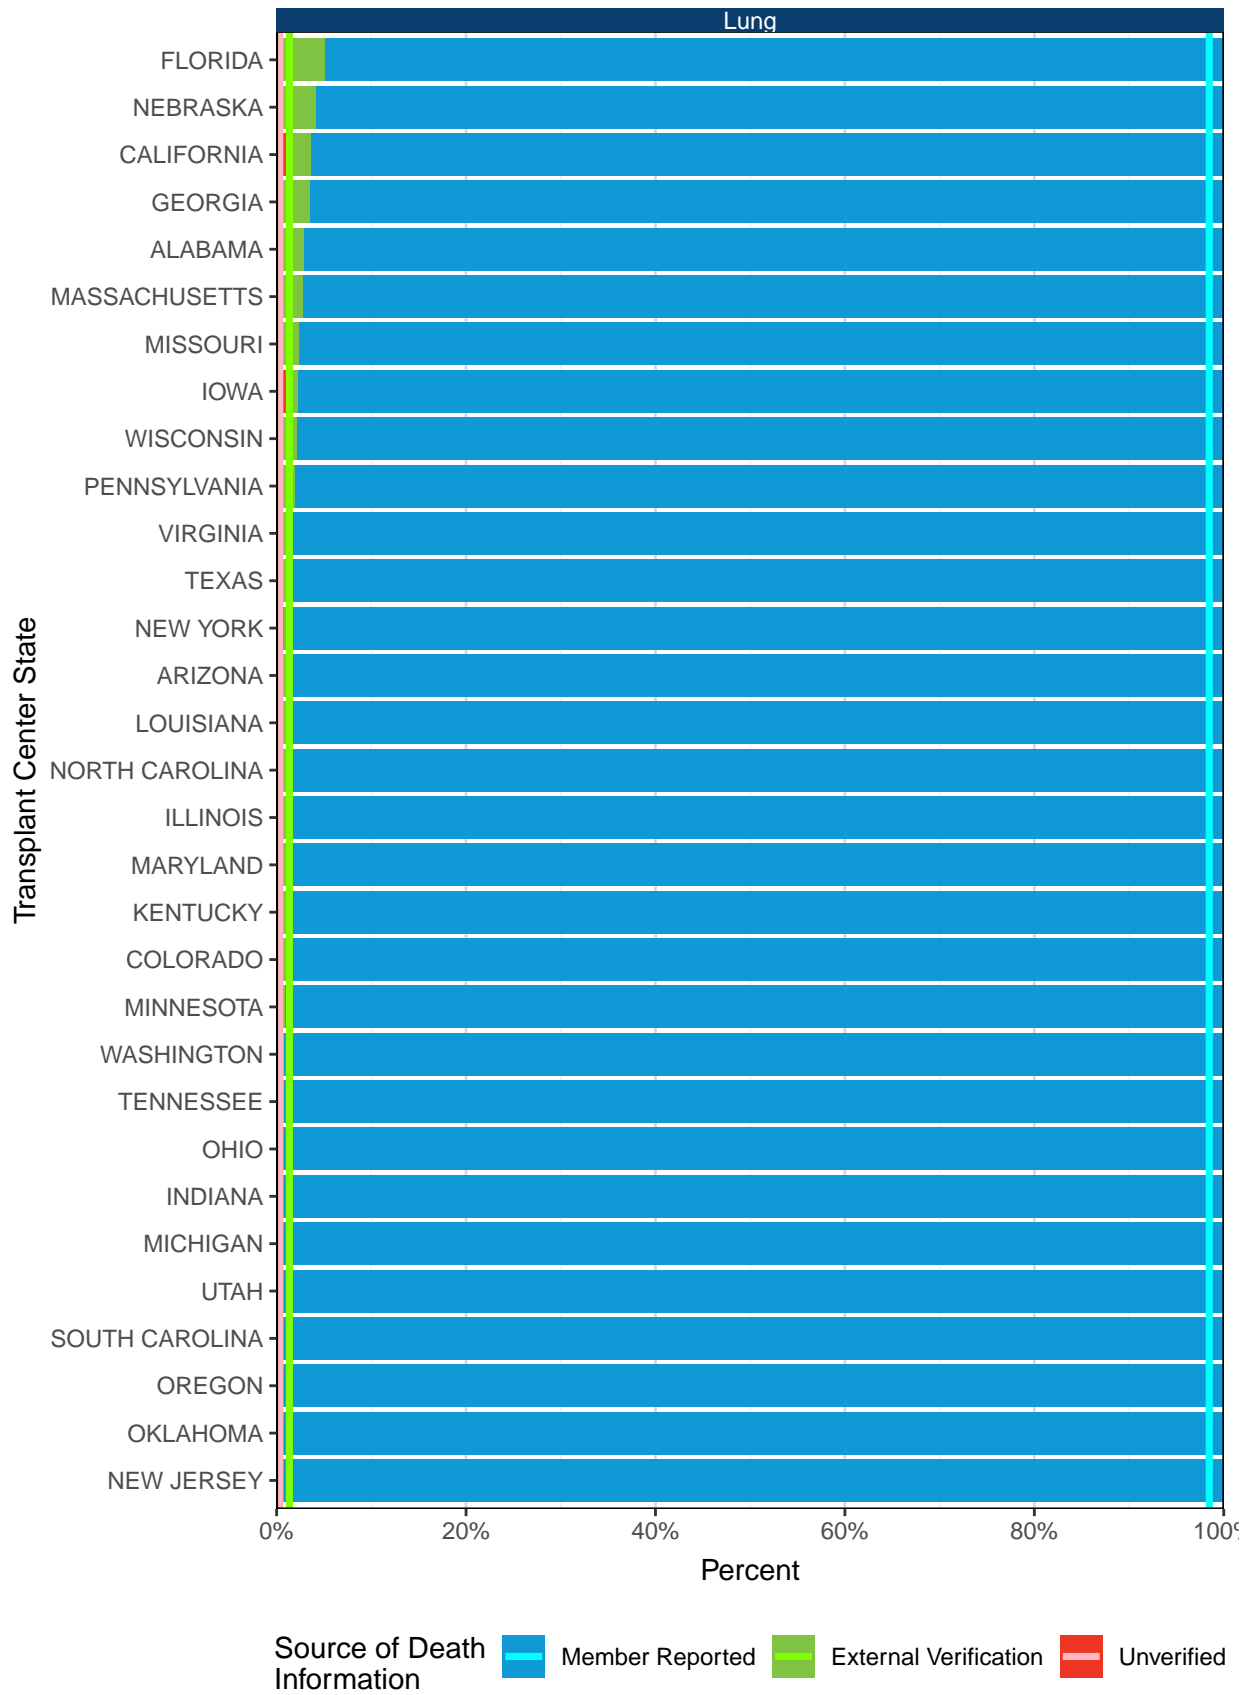

Figure 32: Deaths for transplant recipients during January 1, 2005 - December 31, 2021 by organ, recipient transplant center state, and source of death information. Vertical lines represent medians across states.

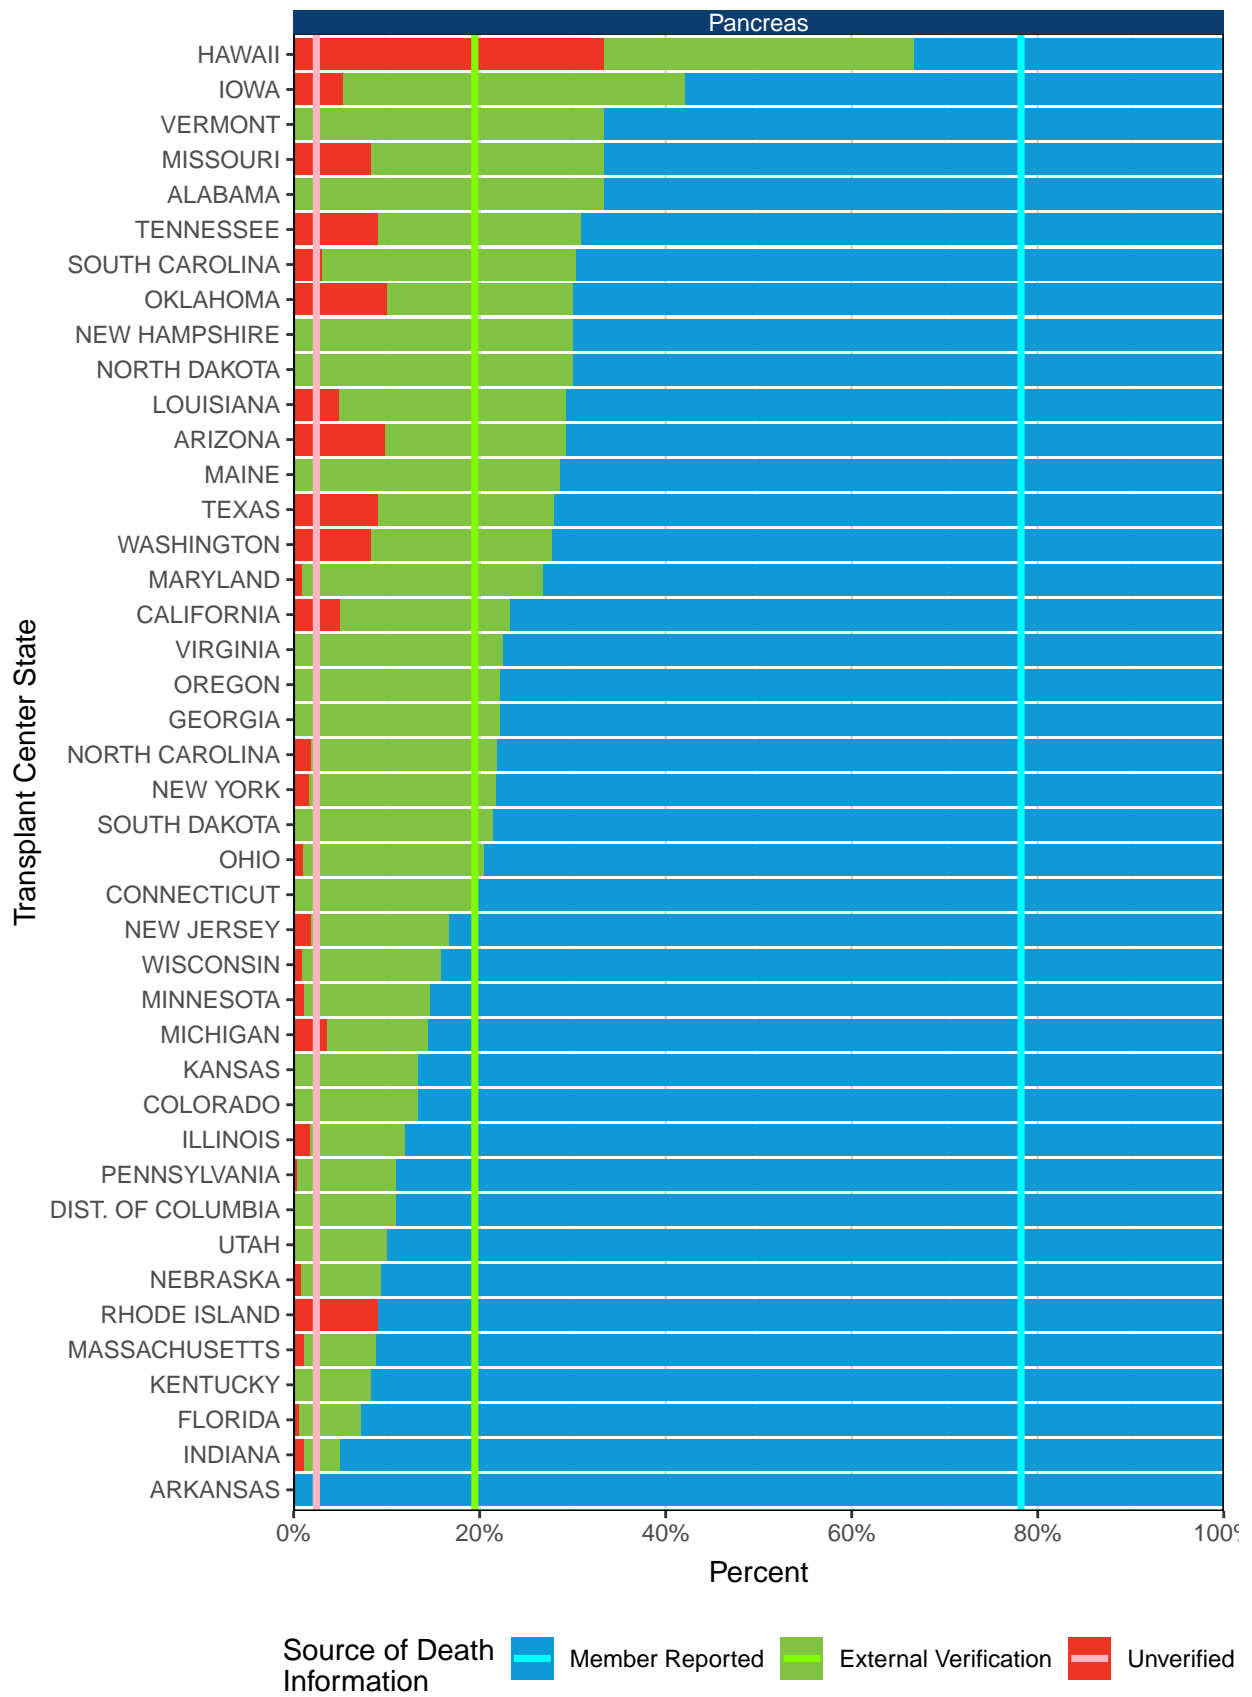

Table 35 provides a summary of the distribution of the number of deaths, from each death source, per transplant center for each organ. Across organs and death sources, the number of transplant recipient deaths per center is right-skewed.

Table 35: Summary of number of deaths for transplant recipients during January 1, 2005 - December 31, 2021 per recipient transplant center by organ and source of death information. Recipient transplant centers for each organ type included if at least one death.

Similarly, Table 36 provides a summary of the percentage of transplant recipient deaths per transplant center from member reported, externally verified, or unverified sources of death information. This is given per center across each organ. For lung transplant recipients, a minimum of 84% of deaths are member reported across all centers. For heart, kidney-pancreas, liver, and pancreas transplant recipients, there was at least one transplant center with 100% of deaths from external verification sources. Half of all transplant centers had at least 81% of transplant recipient deaths from member reported sources.

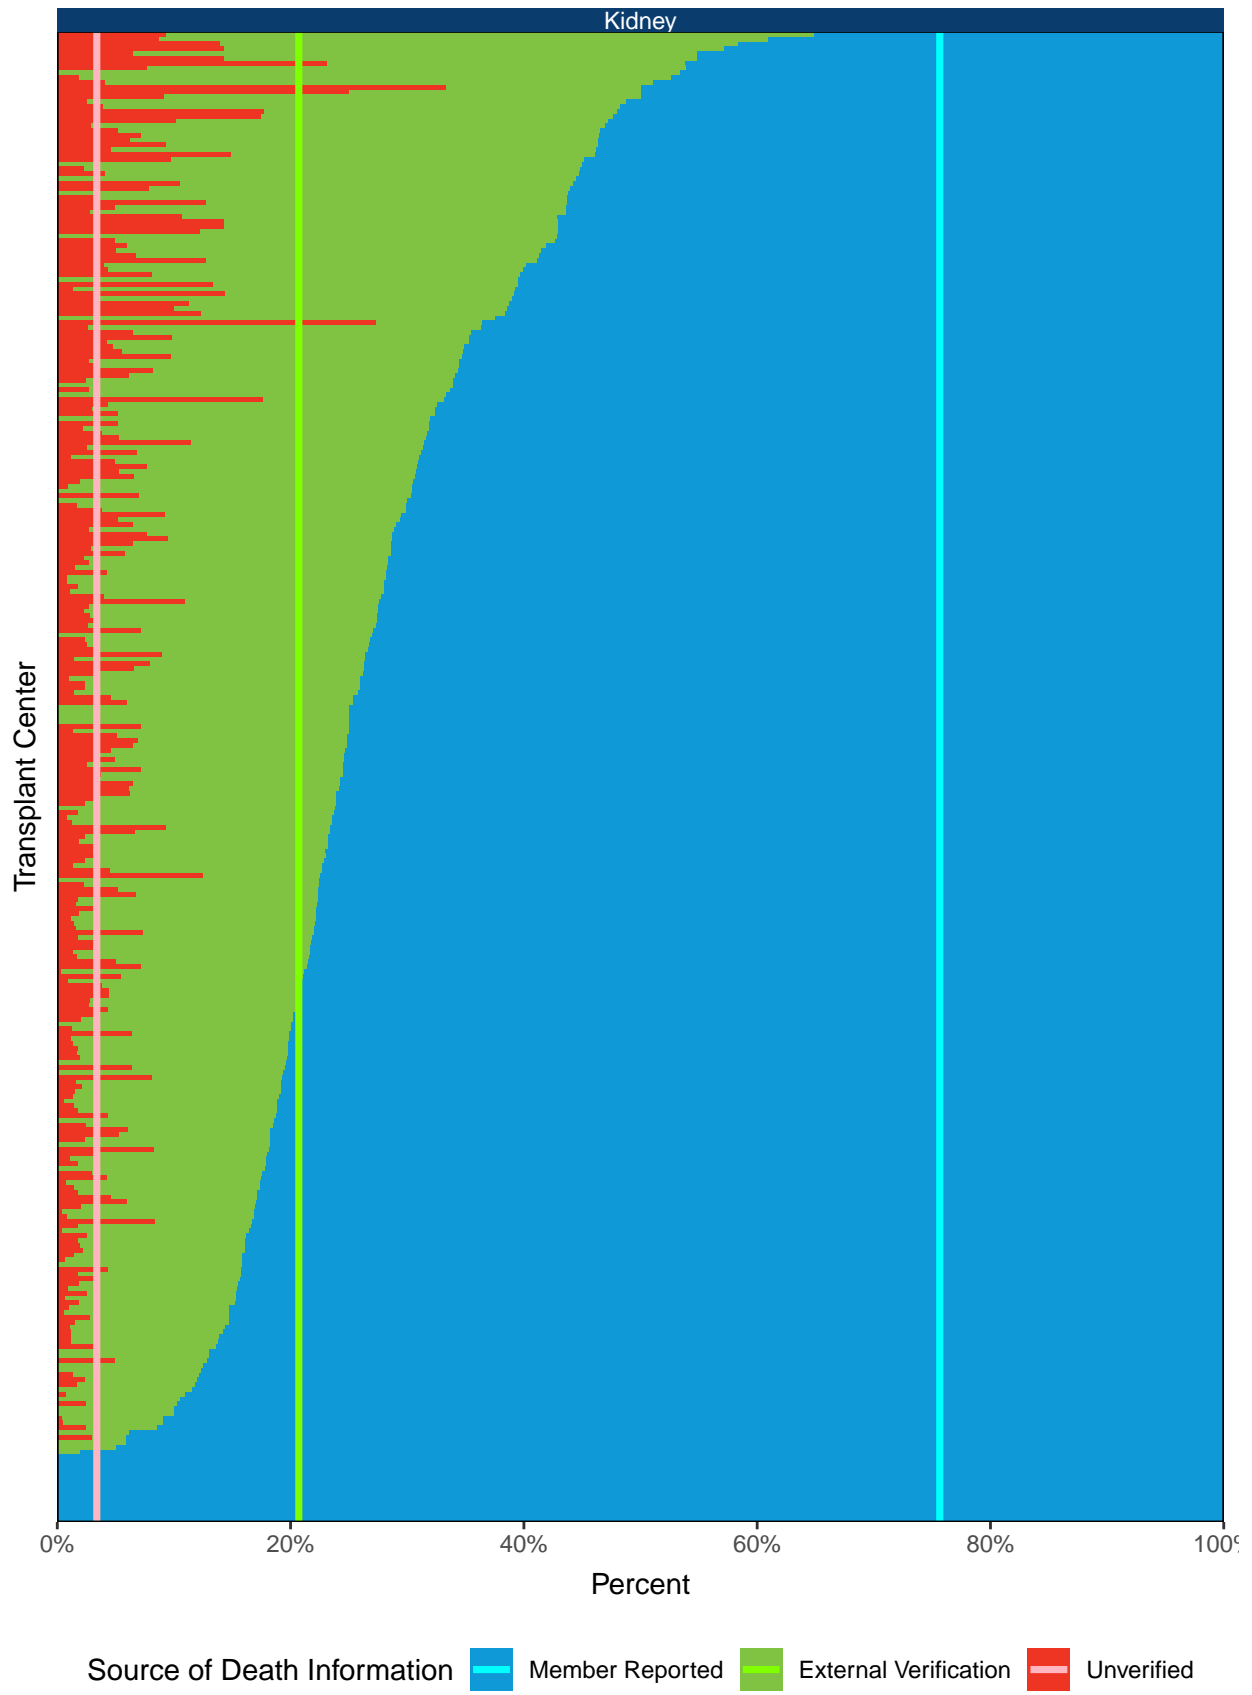

The following figures illustrate the distribution of percentages of source of death information per center for each organ.

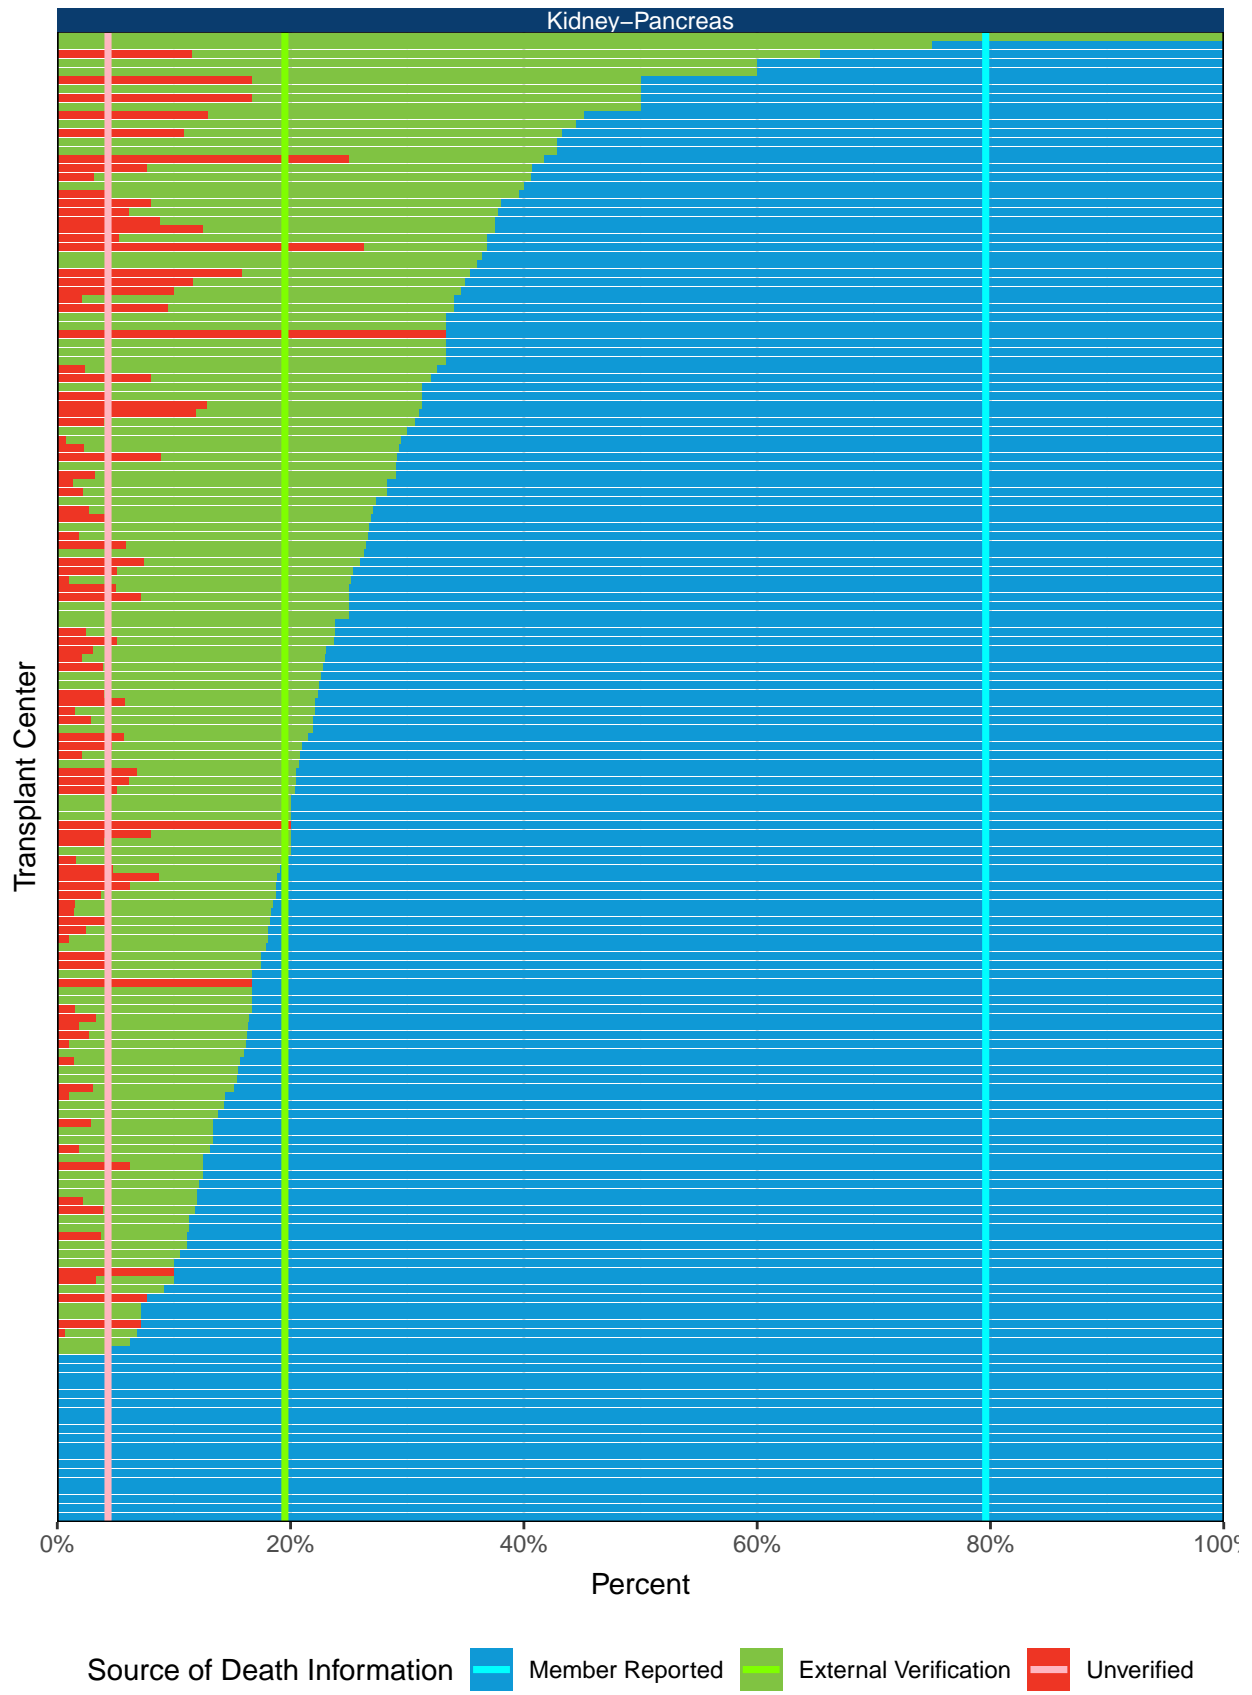

Table 36: Summary of percent of deaths for transplant recipients during January 1, 2005 - December 31, 2021 per recipient transplant center by organ and source of death information. Recipient transplant centers for each organ type included if at least one death.

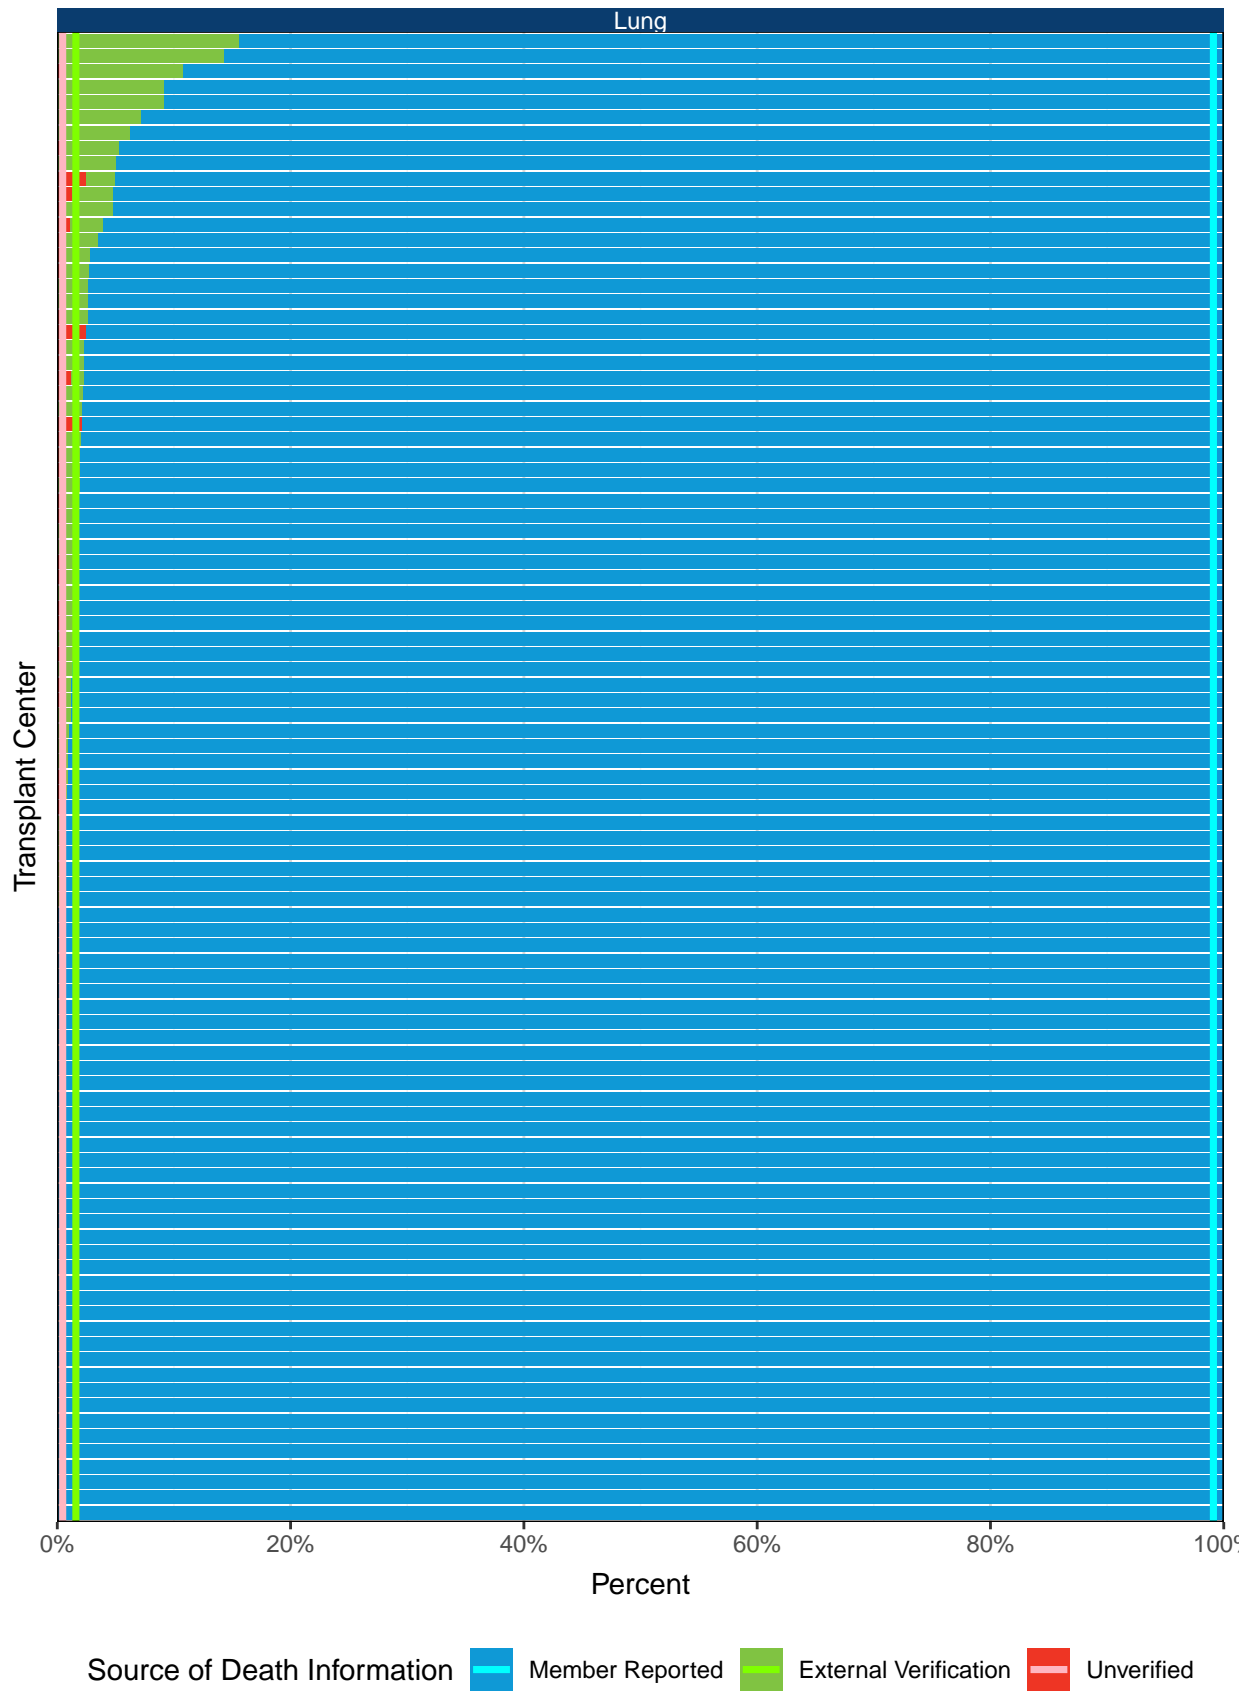

Figure 33: Deaths for transplant recipients during January 1, 2005 - December 31, 2021 by organ, recipient transplant center, and source of death information. Vertical lines represent medians across centers.

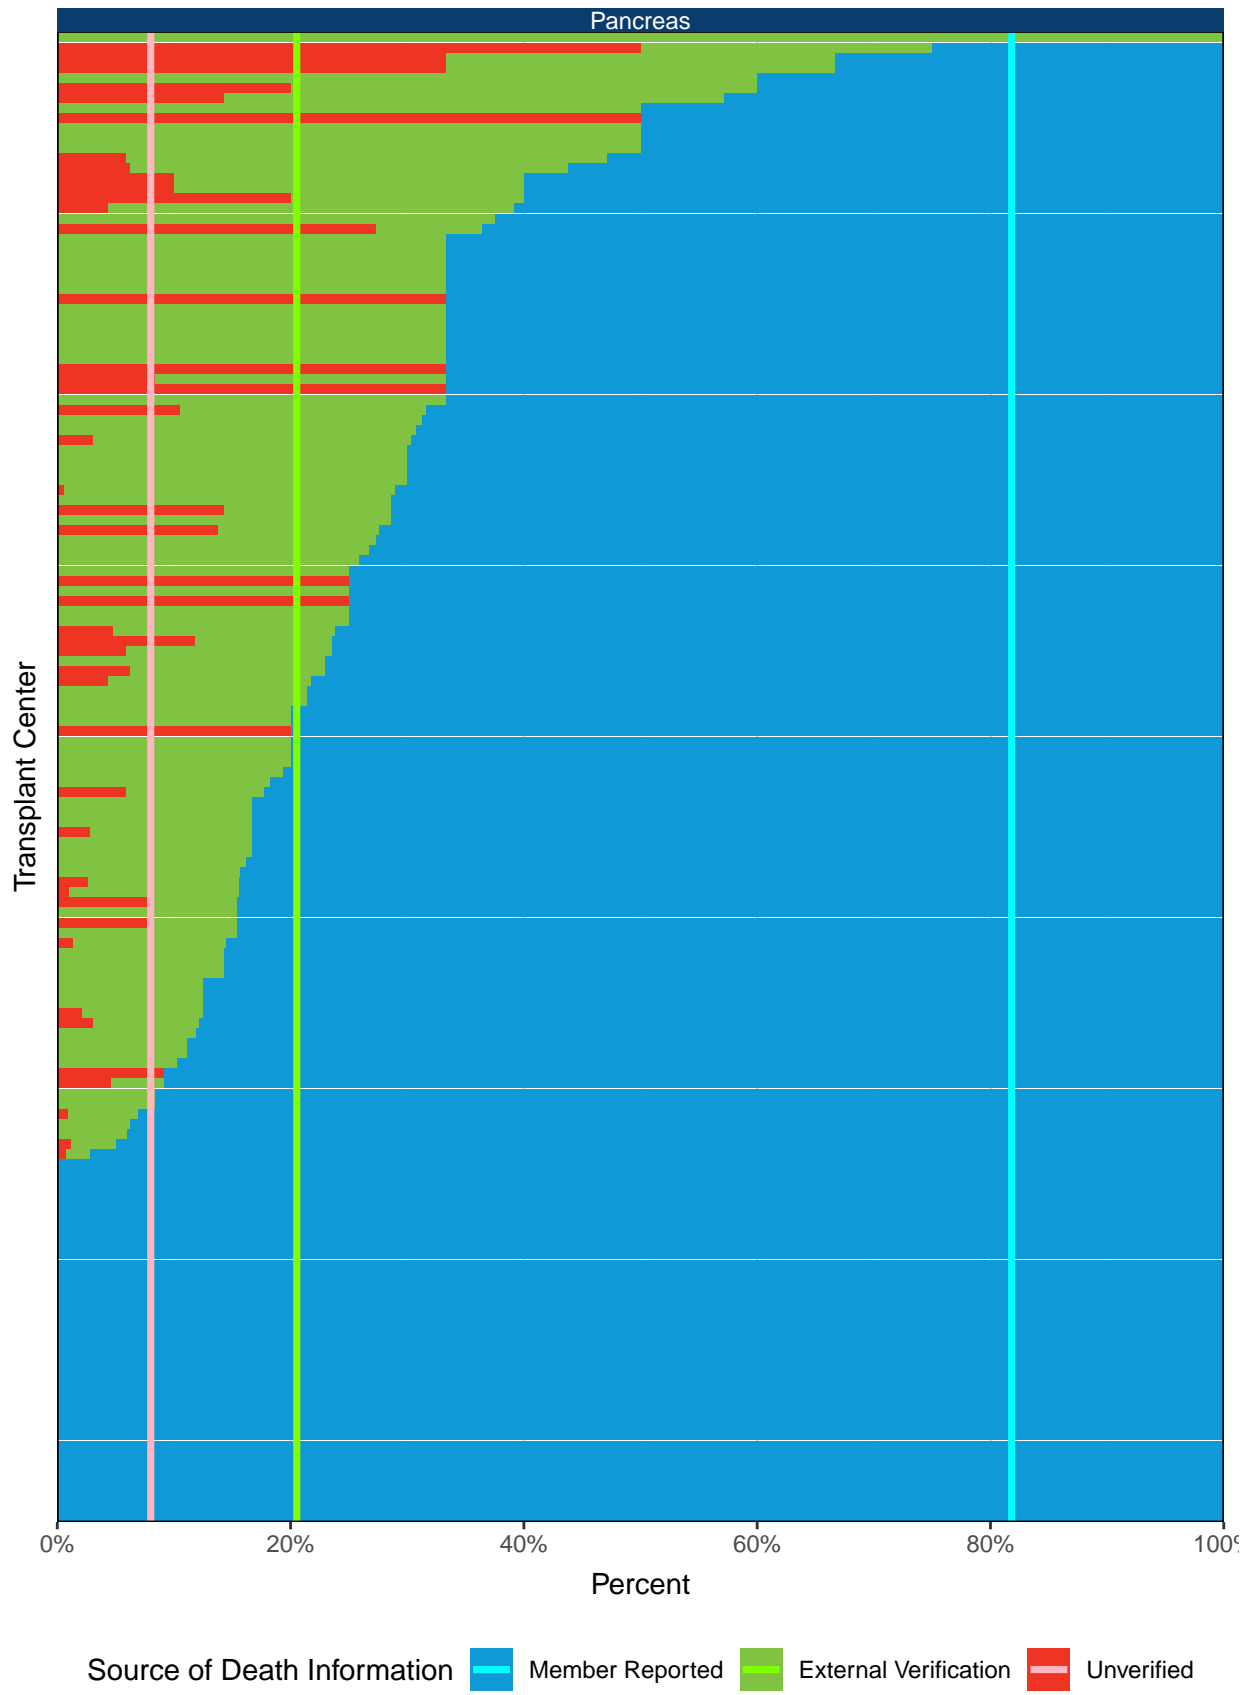

### Waitlist Registrations, Not Removed for Transplant

Because there were few deaths for heart-lung and intestine waitlist registrations from externally verified sources or unverified, these organs will be excluded in the graphics and tables in the rest of this section.

Table 37: Deaths for waitlist registrations not removed for transplant during January 1, 2005 - December 31, 2021 by organ and source of death information.

Organ	Member Reported		External Verification		Unverified	
	N	%	N	%	N	%
Heart	10781	74.1%	3360	23.1%	409	2.8%
Heart-Lung	436	87.6%	57	11.4%	5	1.0%
Intestine	548	91.2%	50	8.3%	3	0.5%
Kidney	121150	70.0%	44938	26.0%	6889	4.0%
Kidney-Pancreas	4838	79.4%	1102	18.1%	151	2.5%
Liver	44347	73.4%	14022	23.2%	2042	3.4%
Lung	7049	79.0%	1695	19.0%	183	2.0%
Pancreas	2812	77.1%	757	20.8%	79	2.2%
TOTAL	191961	71.7%	65981	24.6%	9761	3.6%

There was a substantial uptick in deaths for waitlist registrations removed 2005 and later from member-reported death sources. A more gradual increase in externally verified deaths was seen for waitlist registrations removed from 2012 on, which coincides with changes to this process that occurred at this time. The corresponding table is included in the Appendix.

The large majority of deaths across all organs from member-reported sources were for waitlist registrations while they were still on the waiting list (Figure 35). There was a surprising proportion of member-reported waitlist registration deaths reported across organs that were over 5 years from time from removal to death (12%). Most waitlist registration deaths from externally verified and unverified sources were over a year from removal and death.

Figure 34: Deaths for waitlist registrations not removed for transplant during January 1, 2005 - December 31, 2021 by organ, year removed, and source of death information. Top panel contains all organs and total, bottom panel excludes kidney and total trends.

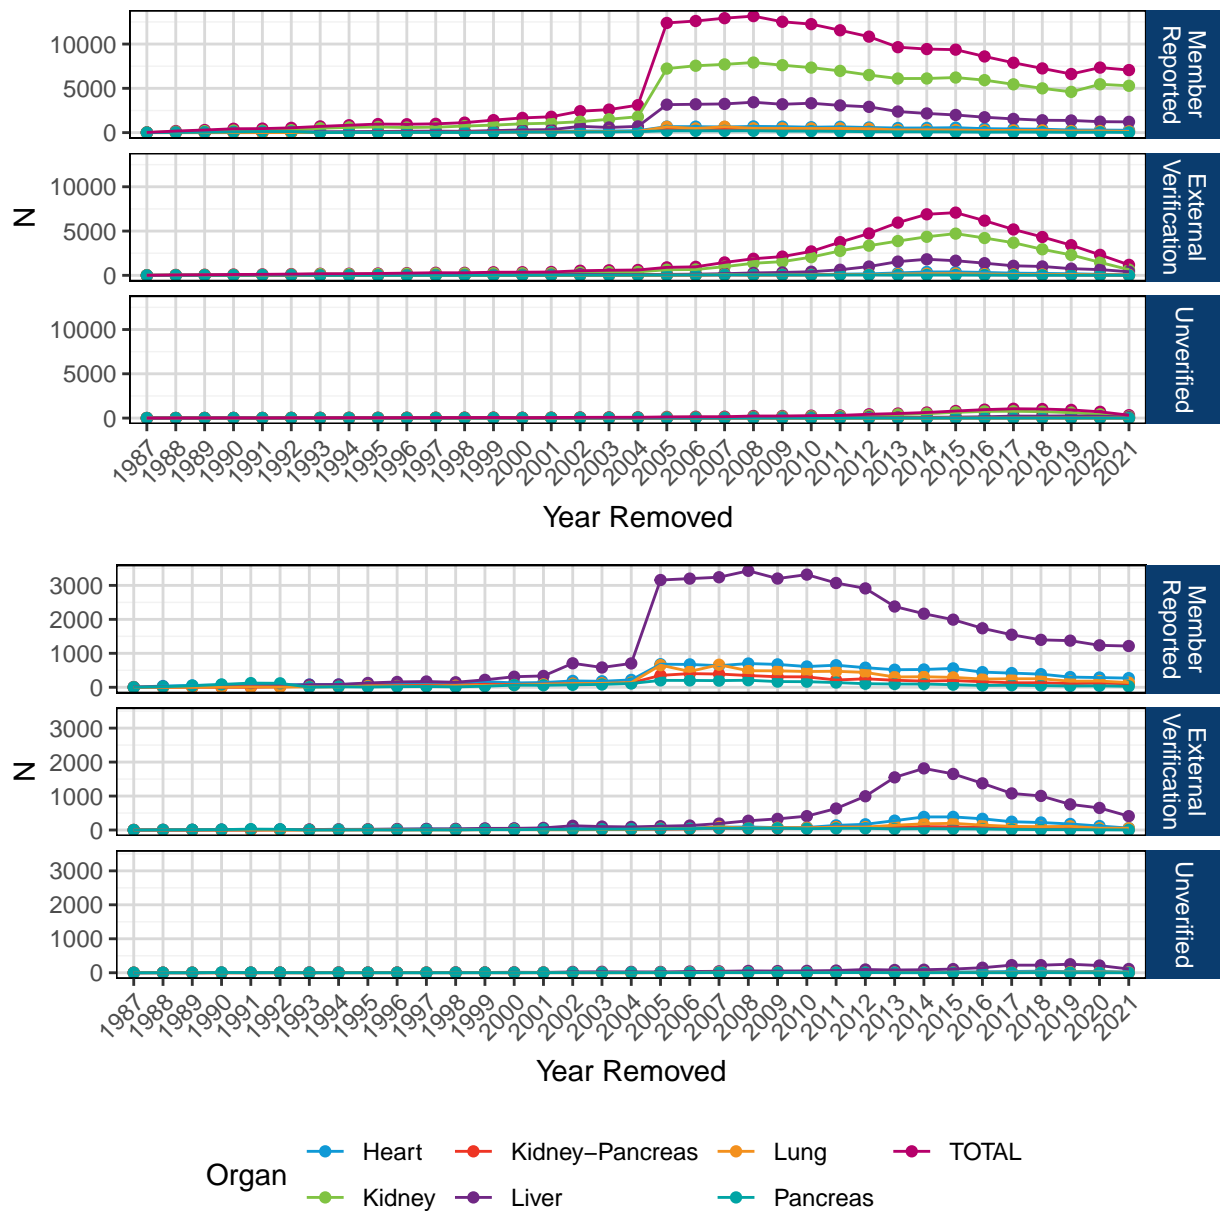

Figure 35: Deaths for waitlist registrations not removed for transplant during January 1, 2005 - December 31, 2021 by organ, time from removal to death, and source of death information. Top panel contains all organs and total, bottom panel excludes kidney and total trends.

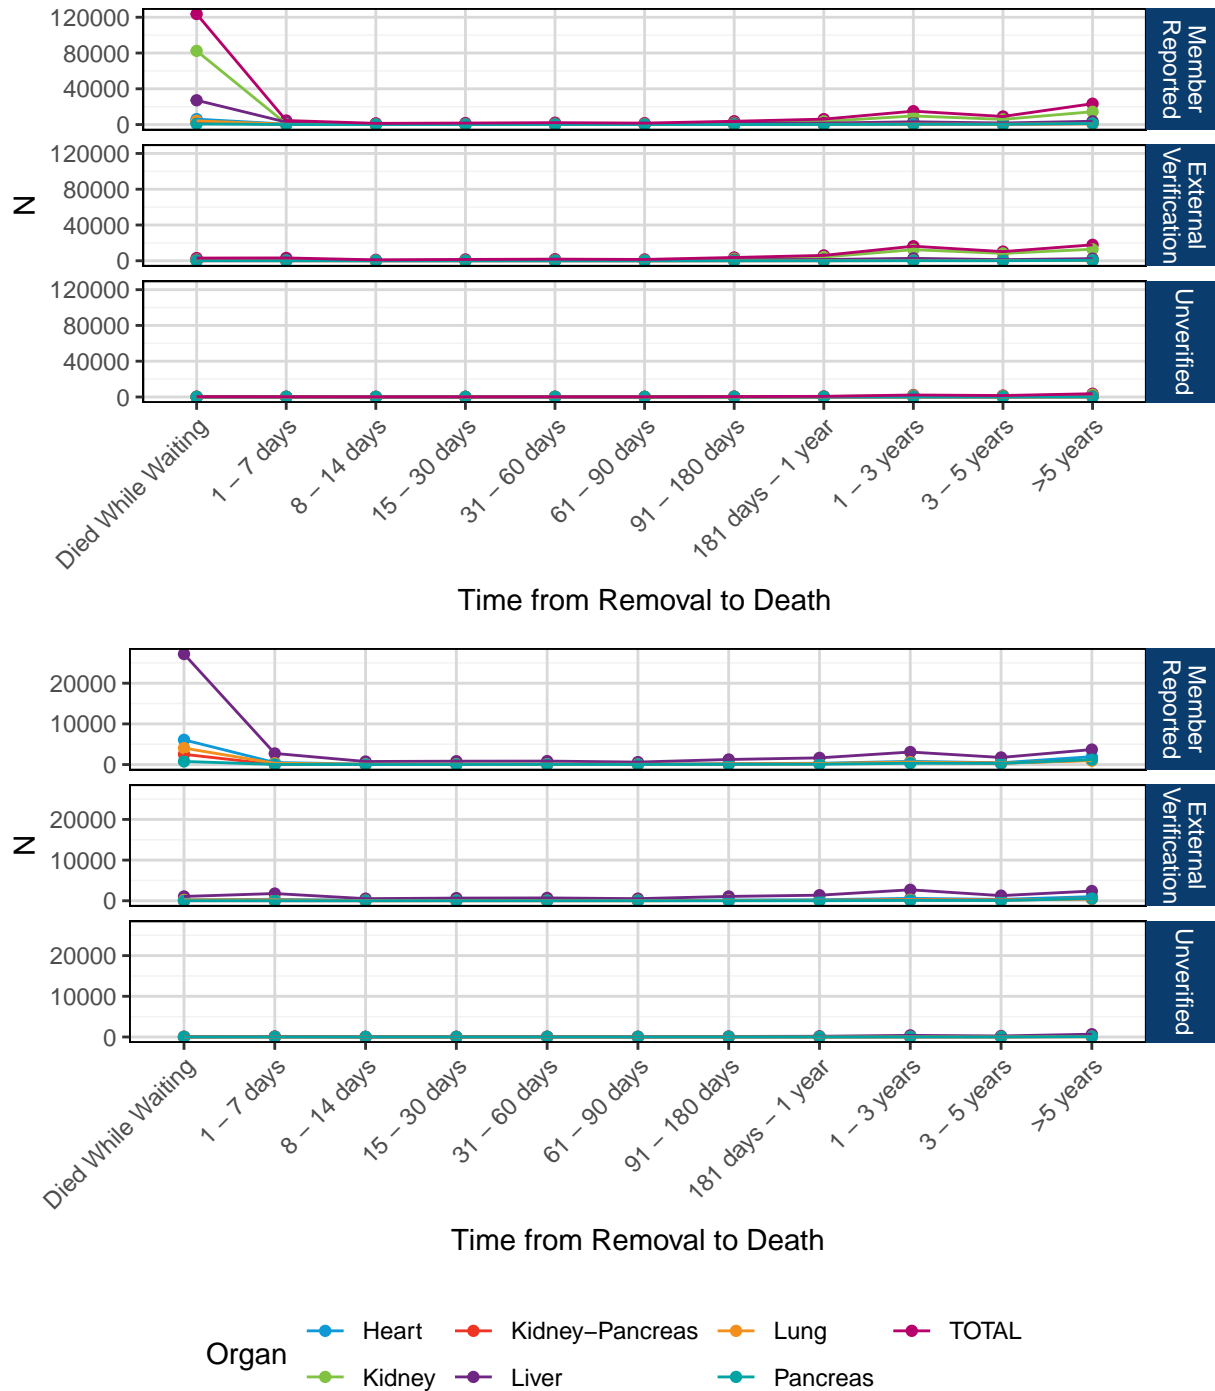

Table 38: Deaths for waitlist registrations not removed for transplant during January 1, 2005 - December 31, 2021 by organ, time from removal to death, and source of death information.

For all organs except pancreas, over 50% of waitlist registrations with member-reported deaths had a removal reason of “Died”. Externally verified deaths for heart, kidney, liver, and lung waitlist registrations were most often removed for “Candidate condition deteriorated, too sick to transplant” followed by “Other”. Externally verified deaths for kidney-pancreas and pancreas waitlist registrations were most often removed for “Other”. Unverified deaths were similarly distributed for heart, kidney, liver, and lung waitlist registrations between “Candidate condition deteriorated, too sick to transplant” and “Other”, while unverified deaths for kidney-pancreas and pancreas waitlist registrations were for “Other” removal reason over 50% of the time.

Again the majority of kidney-pancreas and pancreas waitlist registrations across all death sources were between ages 35-49 at time of removal. For heart, kidney, liver, and lung waitlist registrations across all death sources, the largest proportions of deaths were for ages 50-64 at time of removal. Particularly for heart, kidney, and liver waitlist registrations, 28% of externally verified and unverified sources of death were for ages 65 and older at time of removal.

Figure 37: Deaths for waitlist registrations not removed for transplant during January 1, 2005 - December 31, 2021 by organ, candidate age at removal, and source of death information.

Overall, approximately 25% of waitlist registrations for each death source are Black, Non-Hispanic, while 15% of member-reported and externally verified death sources and 25% of unverified death sources are Hispanic/Latino. These proportions varied by organ; however, within each organ type, there was a higher proportion of unverified deaths that were Hispanic/Latino compared to member reported and externally verified. Kidney waitlist registration deaths had the highest proportions of Black, Non-Hispanics across death sources, while liver waitlist registration deaths had the lowest.

There were no consistent patterns across organs or death source for education level; however, the proportions falling within higher and lower education level were fairly evenly distributed. A larger percentage of pancreas waitlist registrations across death sources had unknown/not reported statuses.

Pancreas waitlist registrations had larger proportions of unknown or not reported insurance status across death sources. Across organs, more waitlist registrations from externally verified and unverified death sources had public insurance. This was mixed across organs for member-reported deaths; heart, liver, and lung waitlist registrations were more often from private insurance while kidney, kidney-pancreas, and pancreas waitlist registrations had public insurance.

Similarly, Table 46 provides a summary of the percentage of waitlist registration deaths per listing center state from member reported, externally verified, or unverified sources of death information. This is given per state across each organ. For heart waitlist registrations, a minimum of 62% of deaths are member reported across all states. On the other hand, there was at least one state with 100% of heart waitlist registrations from unverified death sources and at least one state with 100% of pancreas waitlist registrations from externally verified death sources. No state had 100% of kidney or liver waitlist registration deaths as member reported.

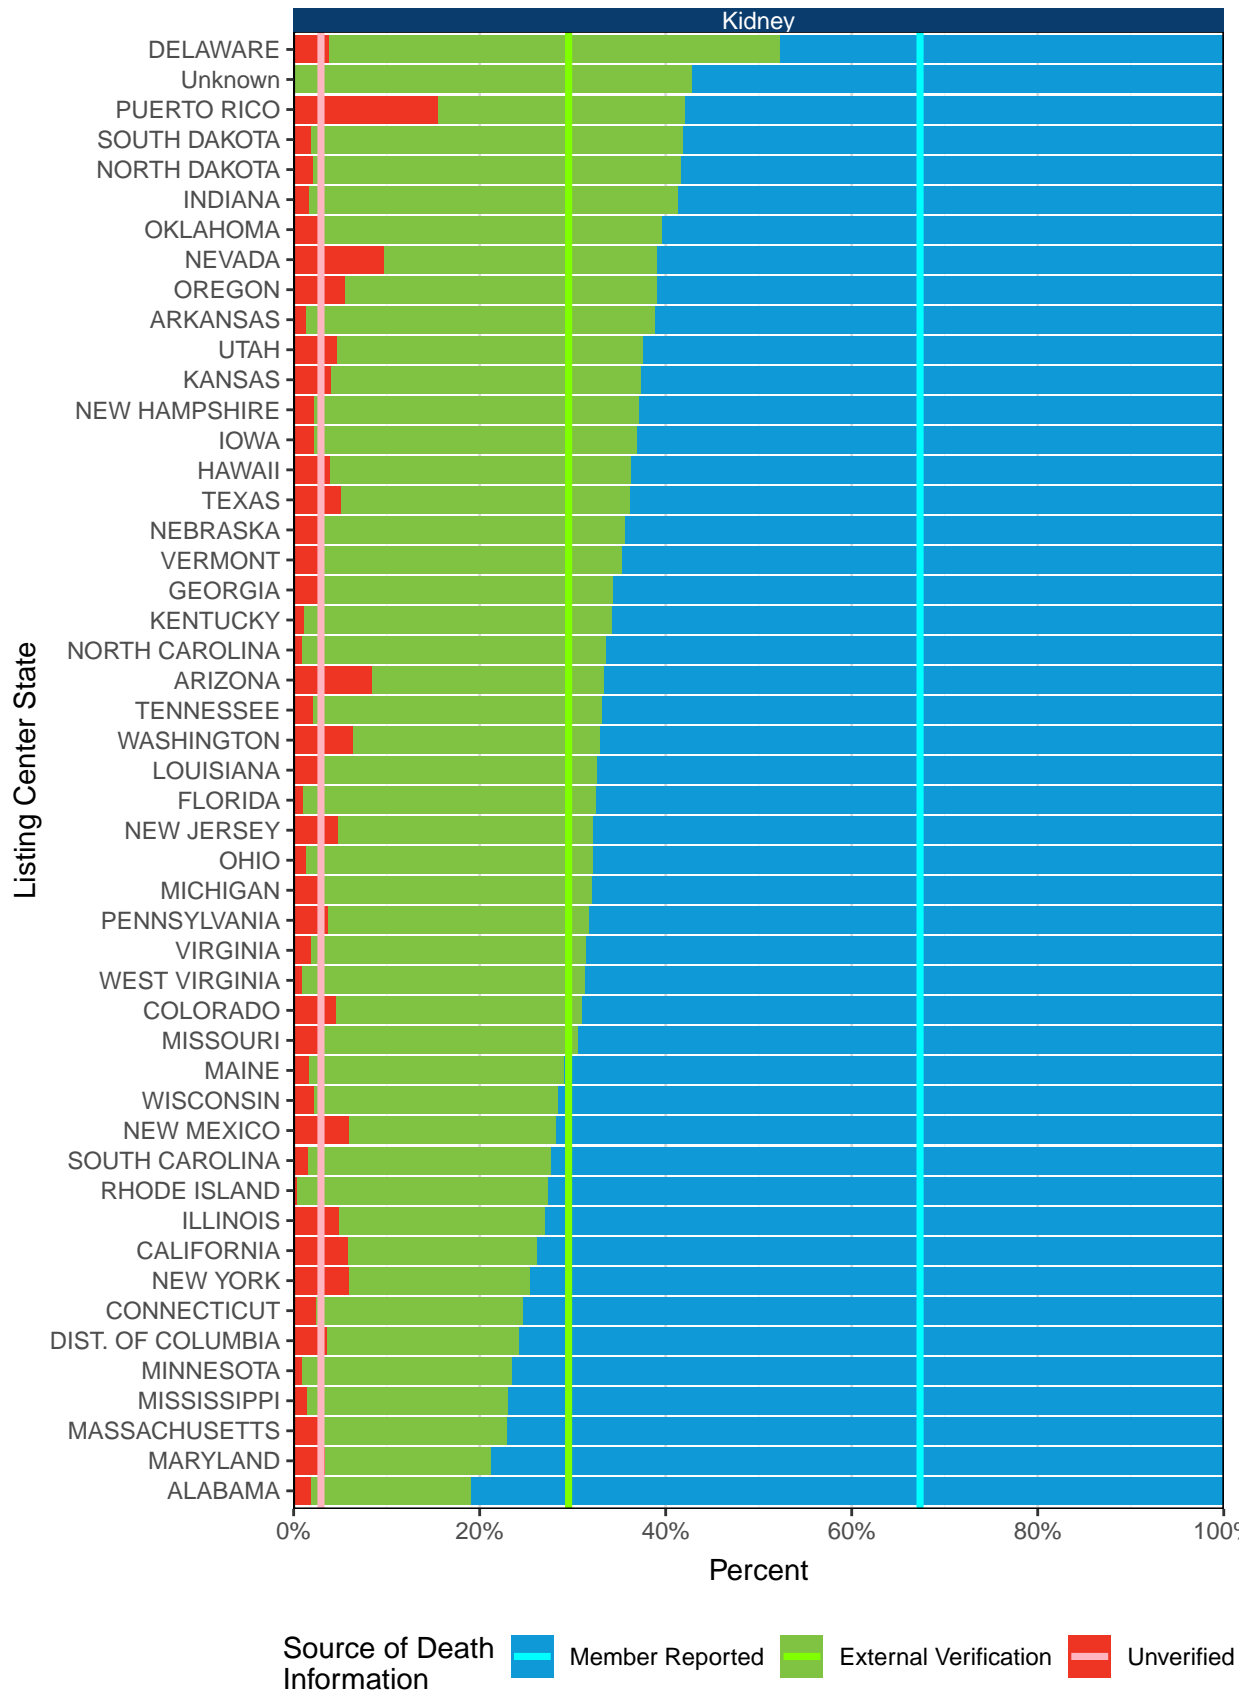

The following figures illustrate the distribution of percentages of source of death information per state for each organ.

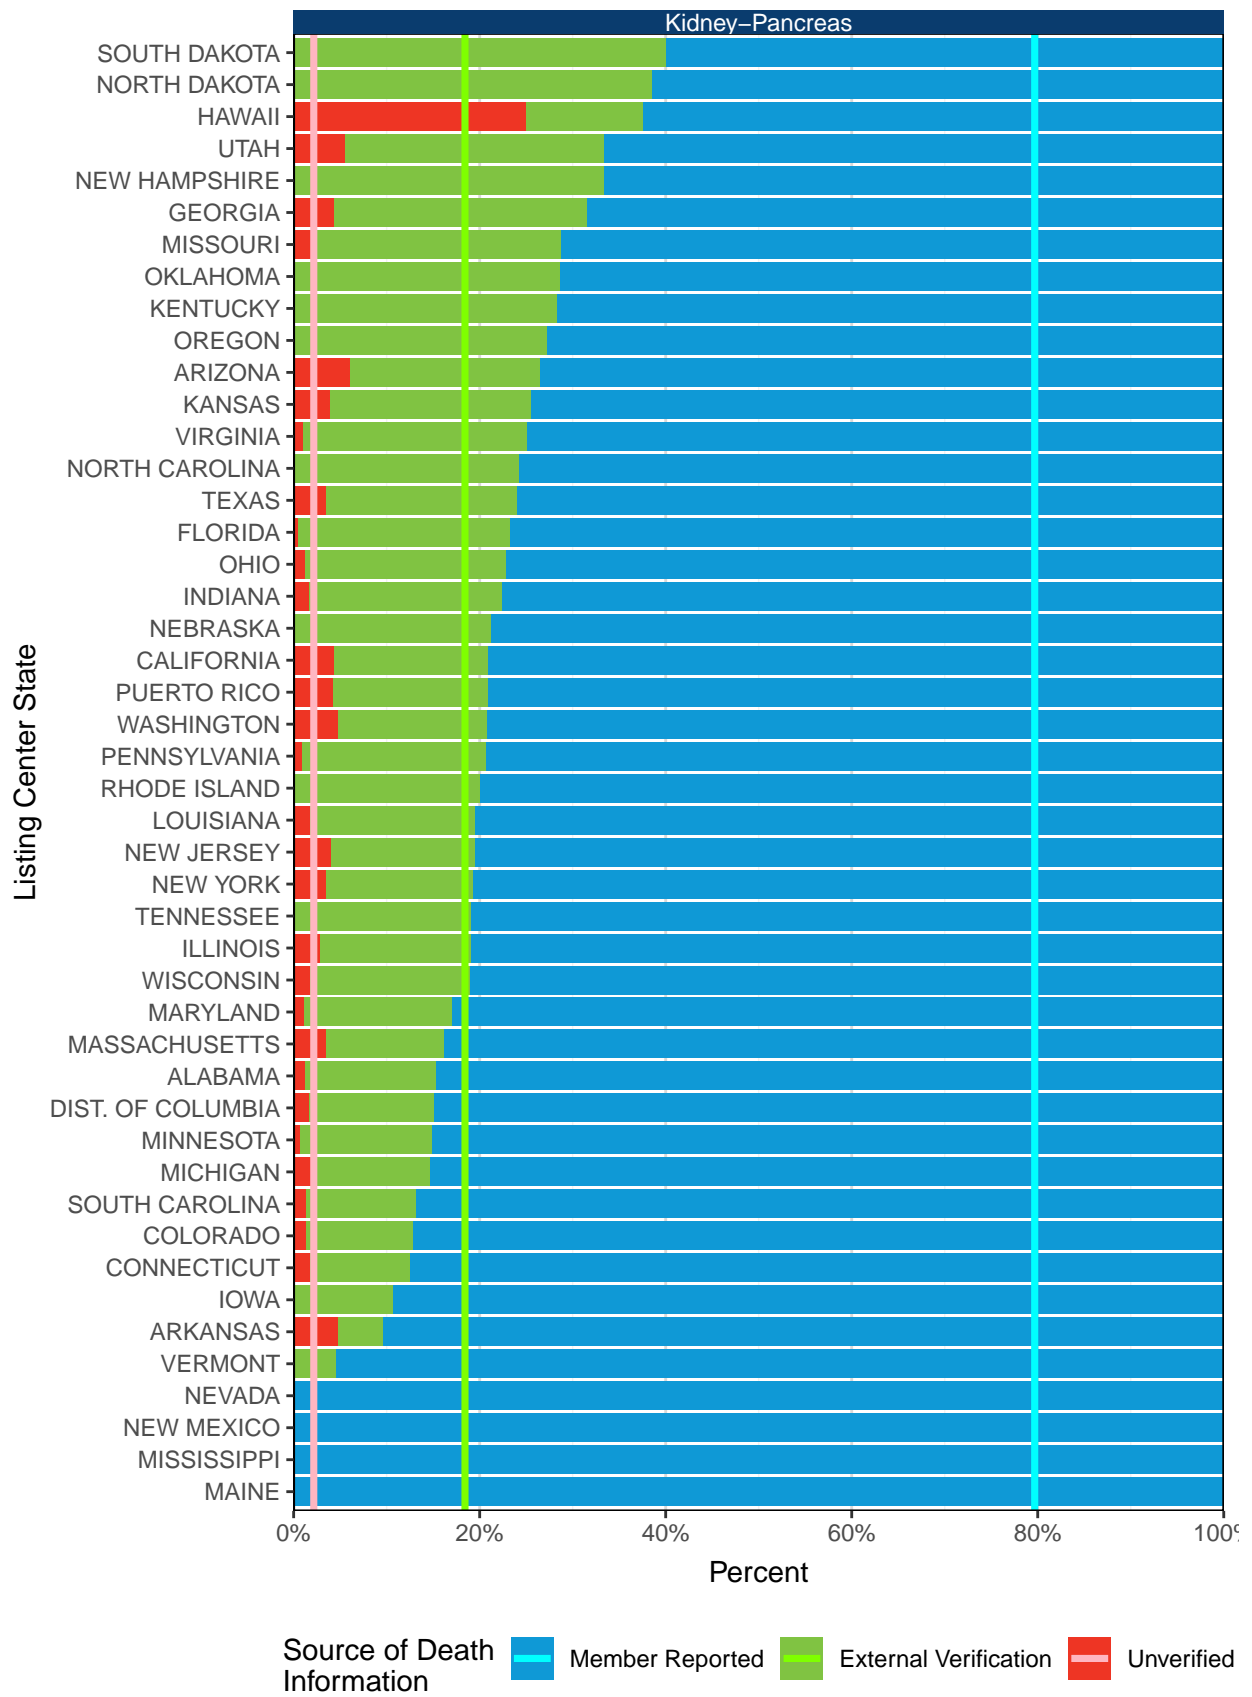

Table 46: Summary of percent of deaths for waitlist registrations not removed for transplant during January 1, 2005 - December 31, 2021 per listing center state by organ and source of death information. Listing center states for each organ type included if at least one death.

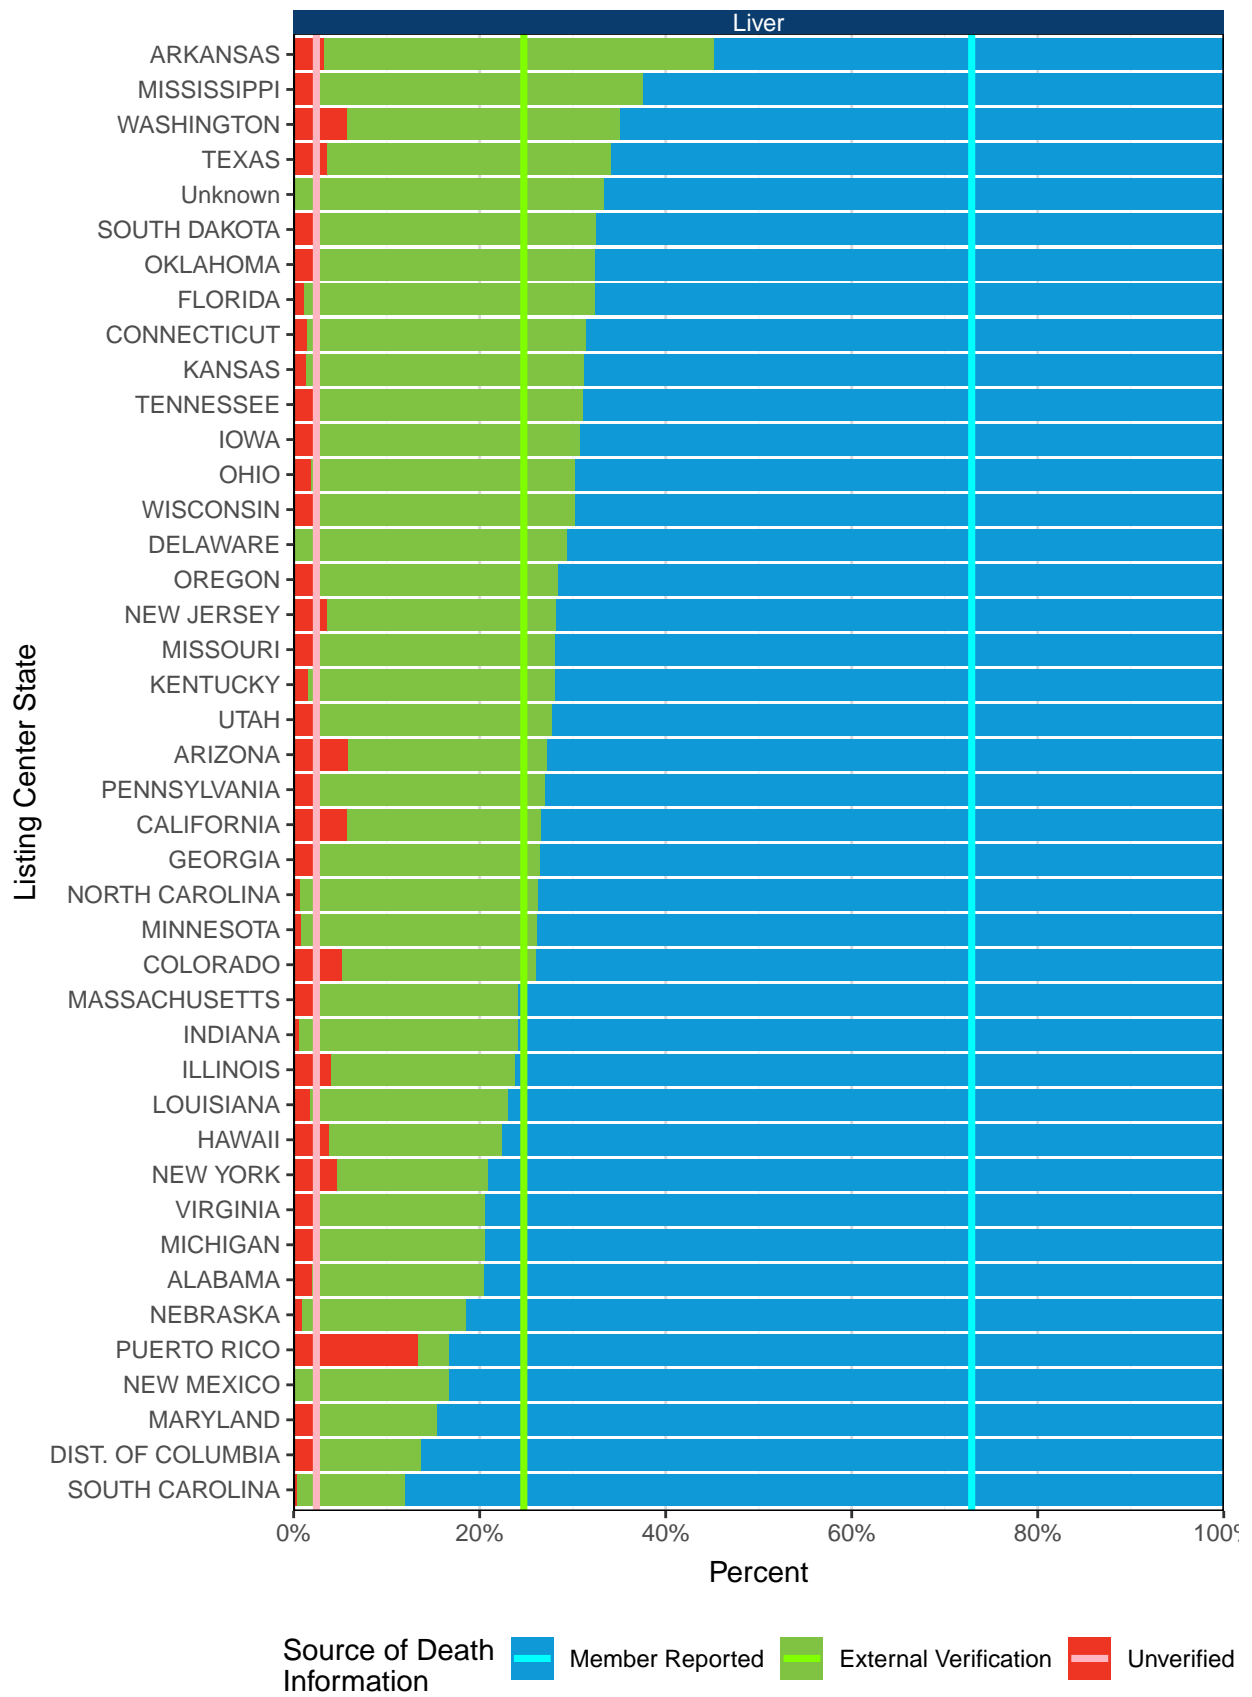

Figure 42: Deaths for waitlist registrations not removed for transplant during January 1, 2005 - December 31, 2021 by organ, listing center state, and source of death information. Vertical lines represent medians across states.

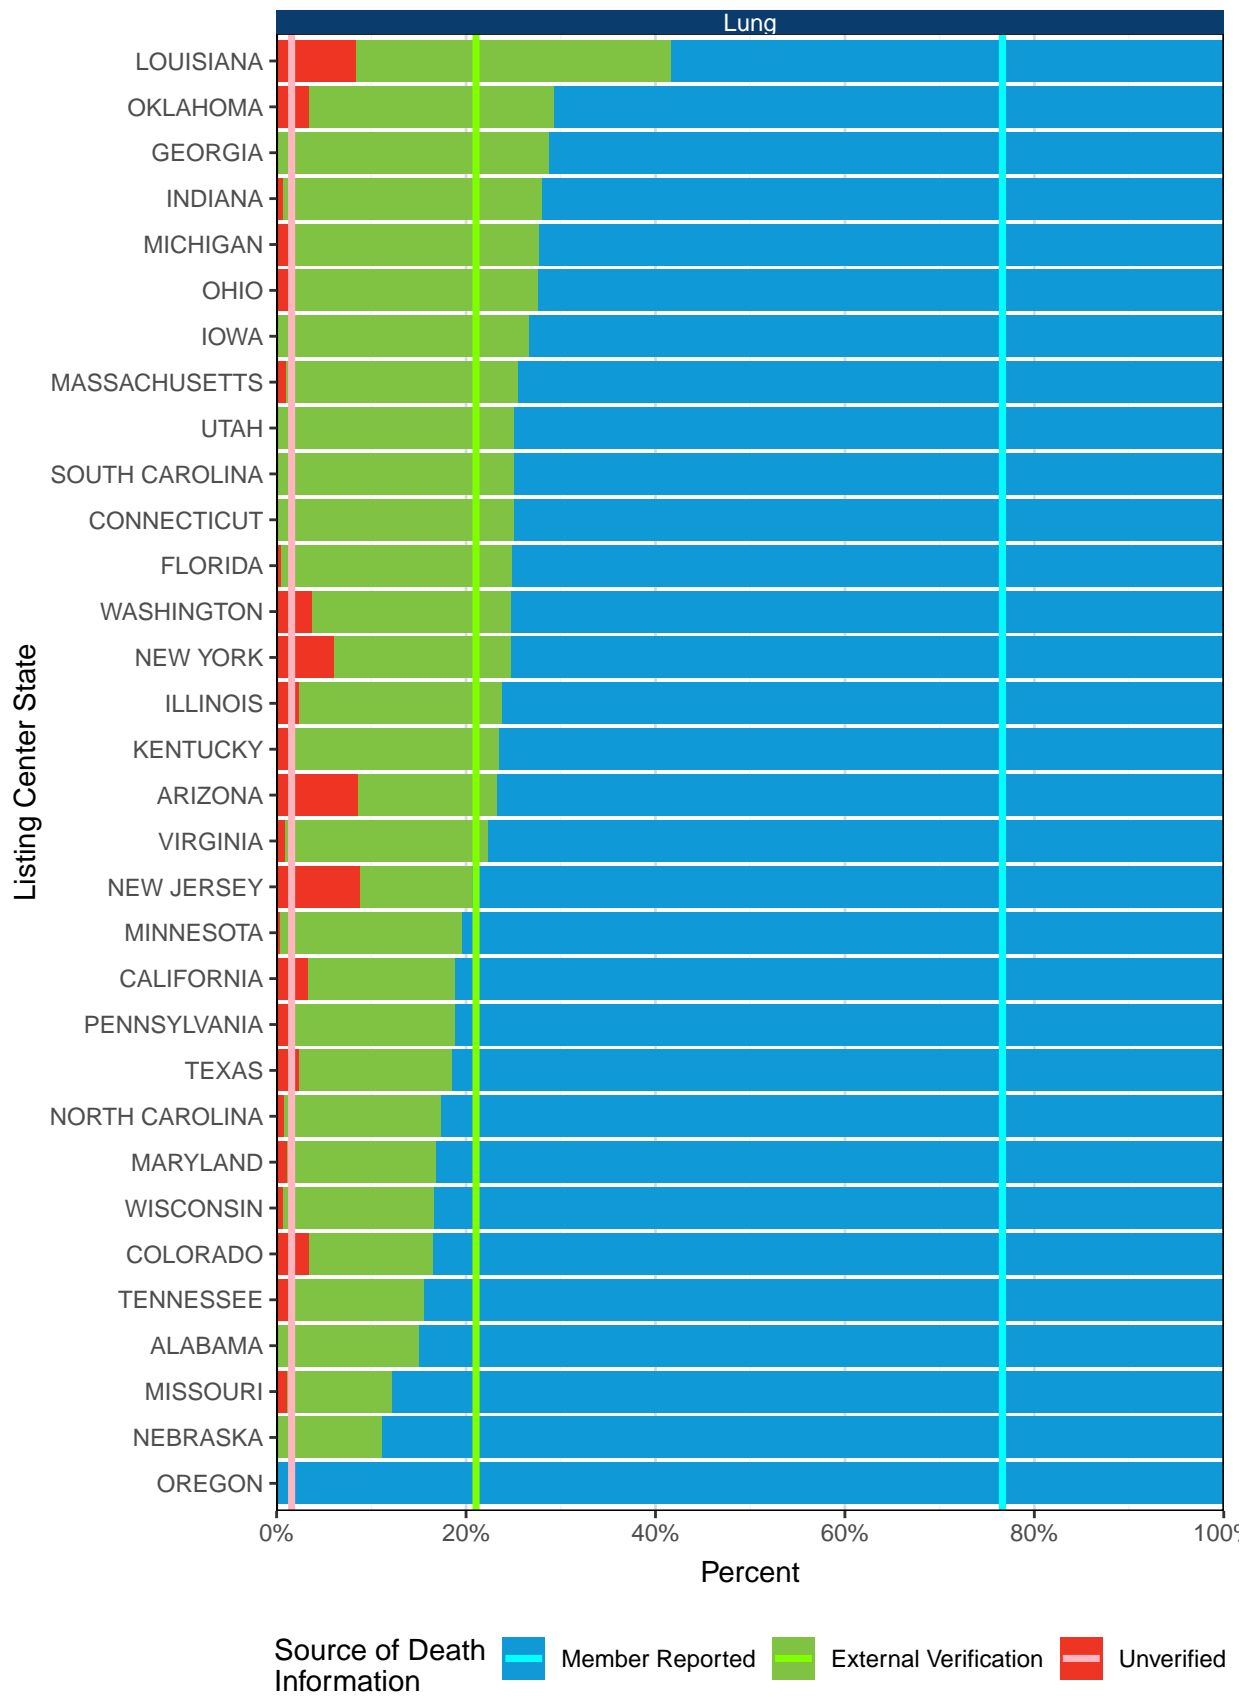

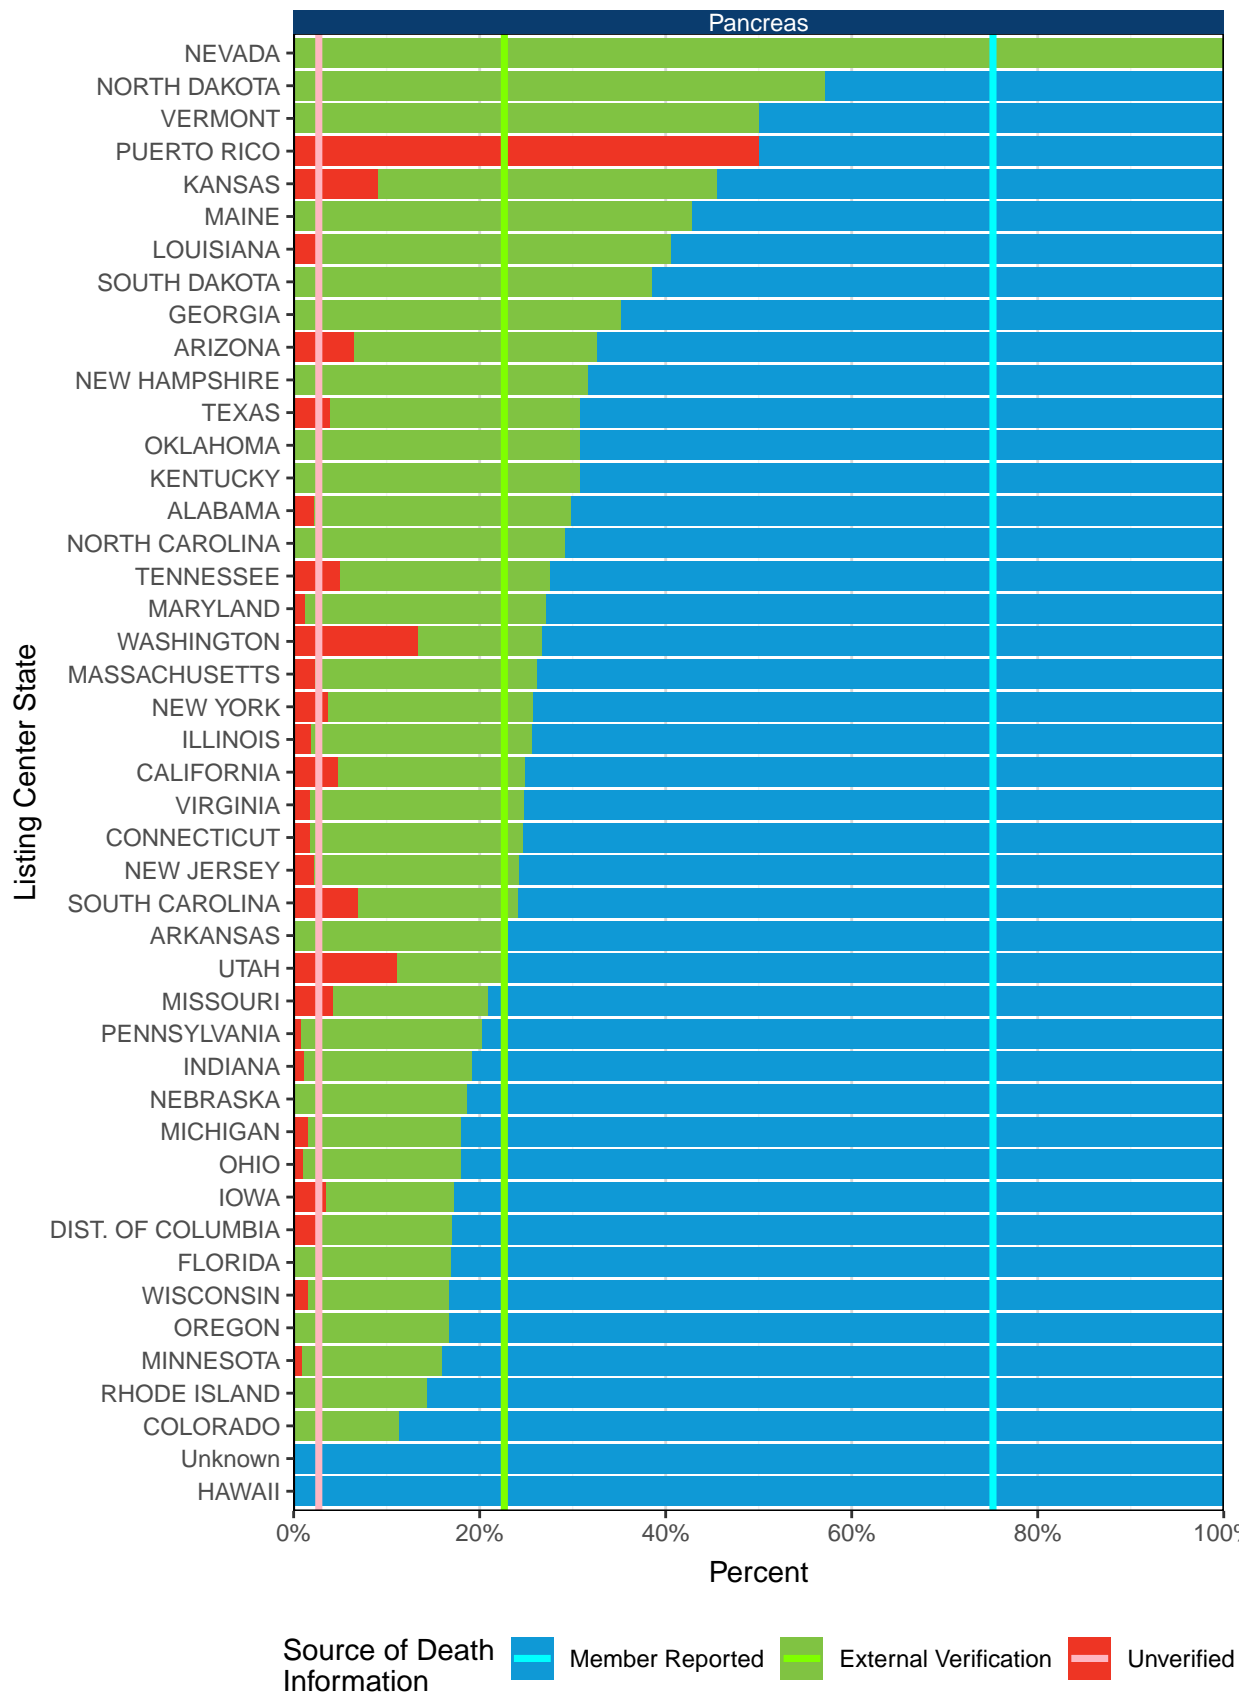

Table 47 provides a summary of the distribution of the number of deaths, from each death source, per listing center for each organ. Across organs and death sources, the number of waitlist registration deaths per center is right-skewed.

Table 47: Summary of number of deaths for waitlist registrations not removed for transplant during January 1, 2005 - December 31, 2021 per listing center by organ and source of death information. Listing centers for each organ type included if at least one death.

The table below provides a summary of the percentage of waitlist registration deaths per listing center from member reported, externally verified, or unverified sources of death information. This is given per center across each organ. There are much lower proportions across organs (11 - 38%) of member reported deaths per center at a minimum, compared to by center for transplant recipients. Half of all listing centers had at least 70% of waitlist registration deaths from member reported sources.

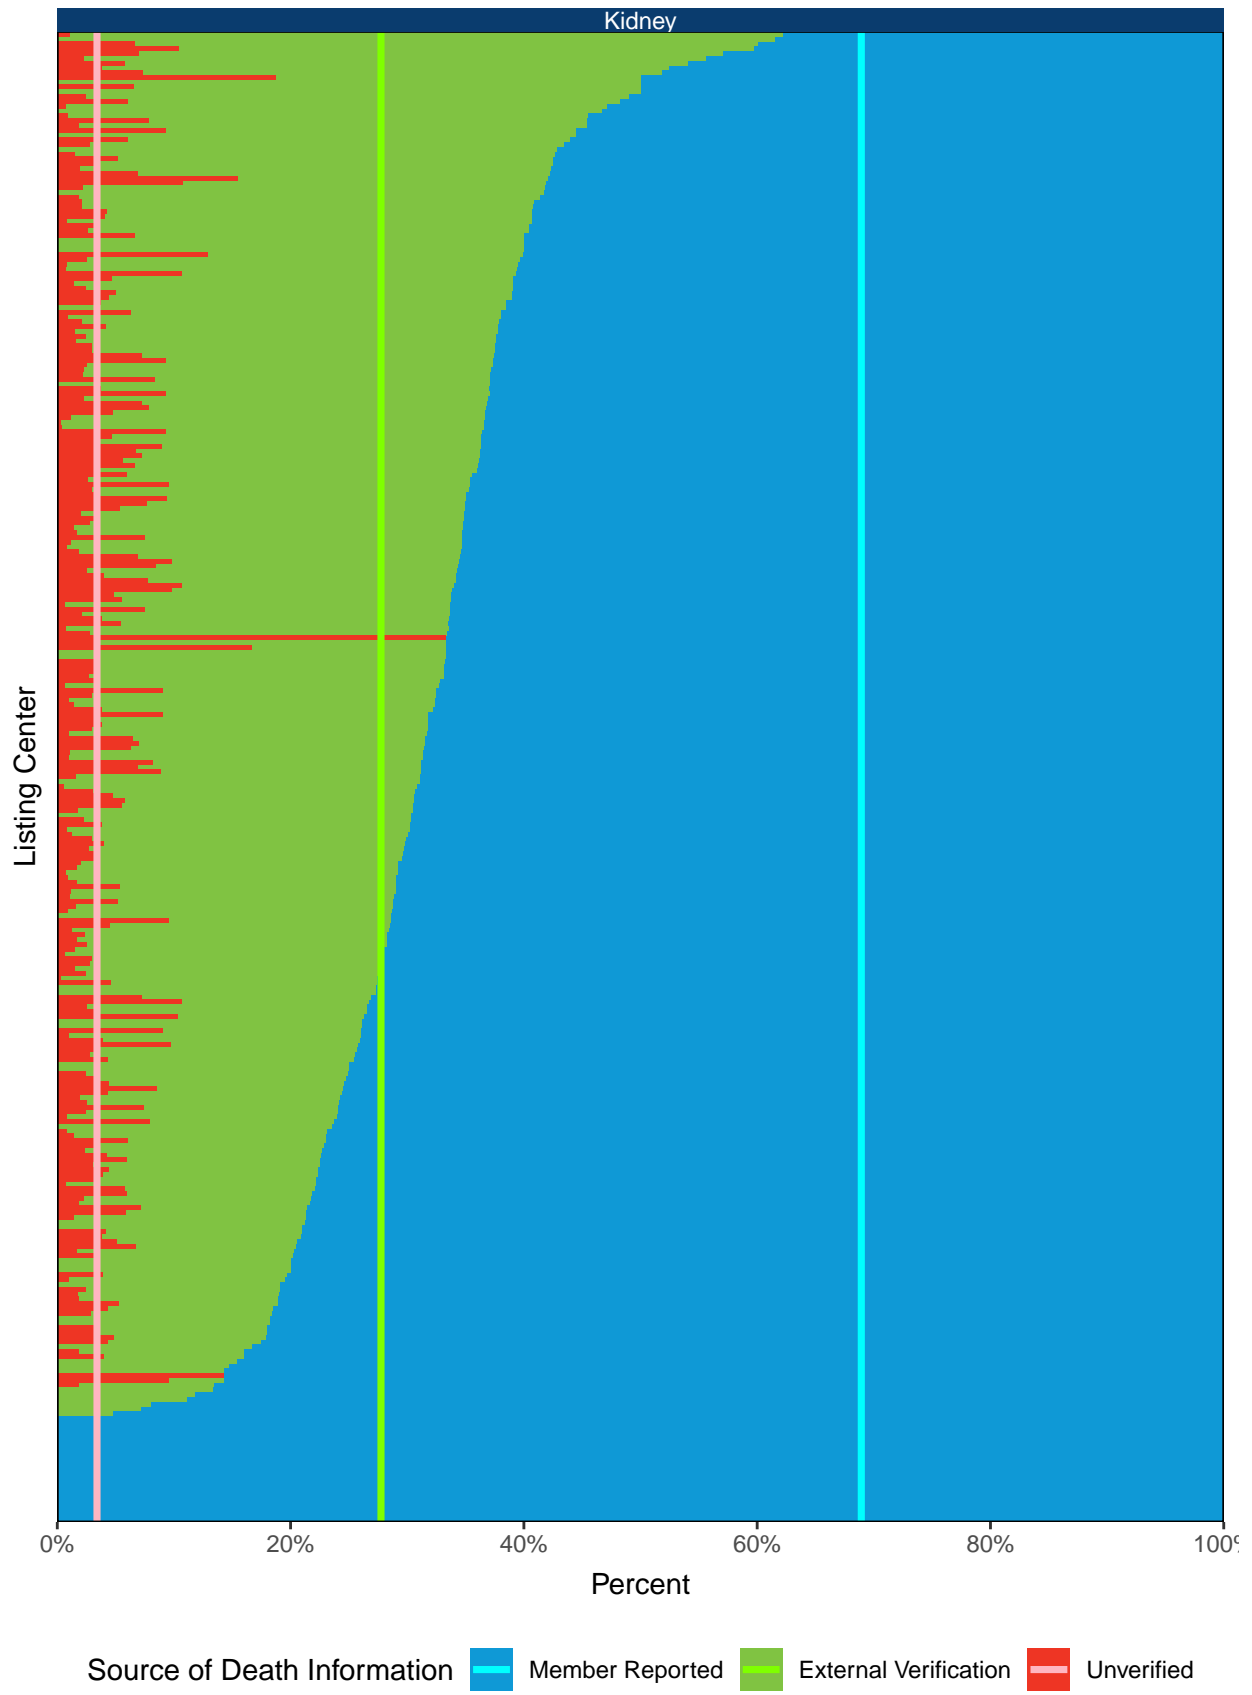

The following figures illustrate the distribution of percentages of source of death information per center for each organ.

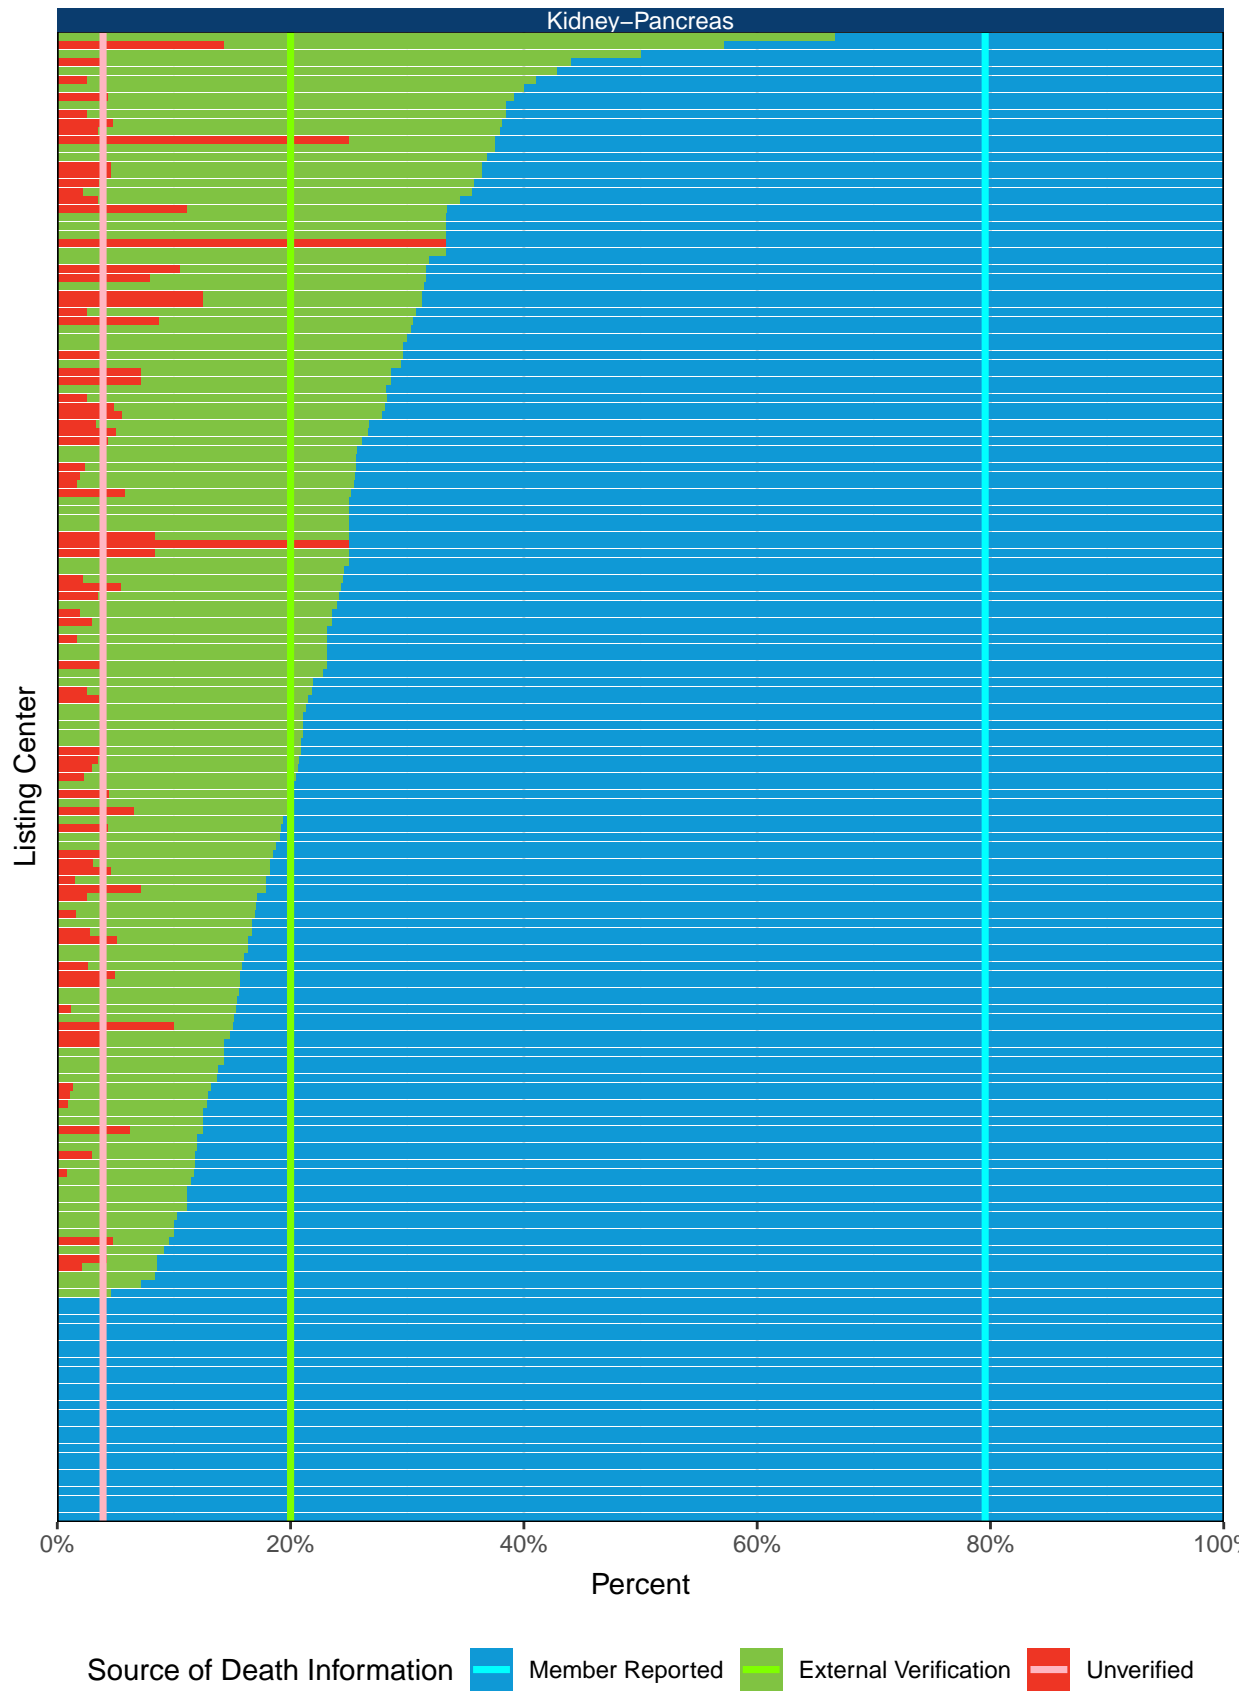

Table 48: Summary of percent of deaths for waitlist registrations not removed for transplant during January 1, 2005 - December 31, 2021 per listing center by organ and source of death information. Listing centers for each organ type included if at least one death.

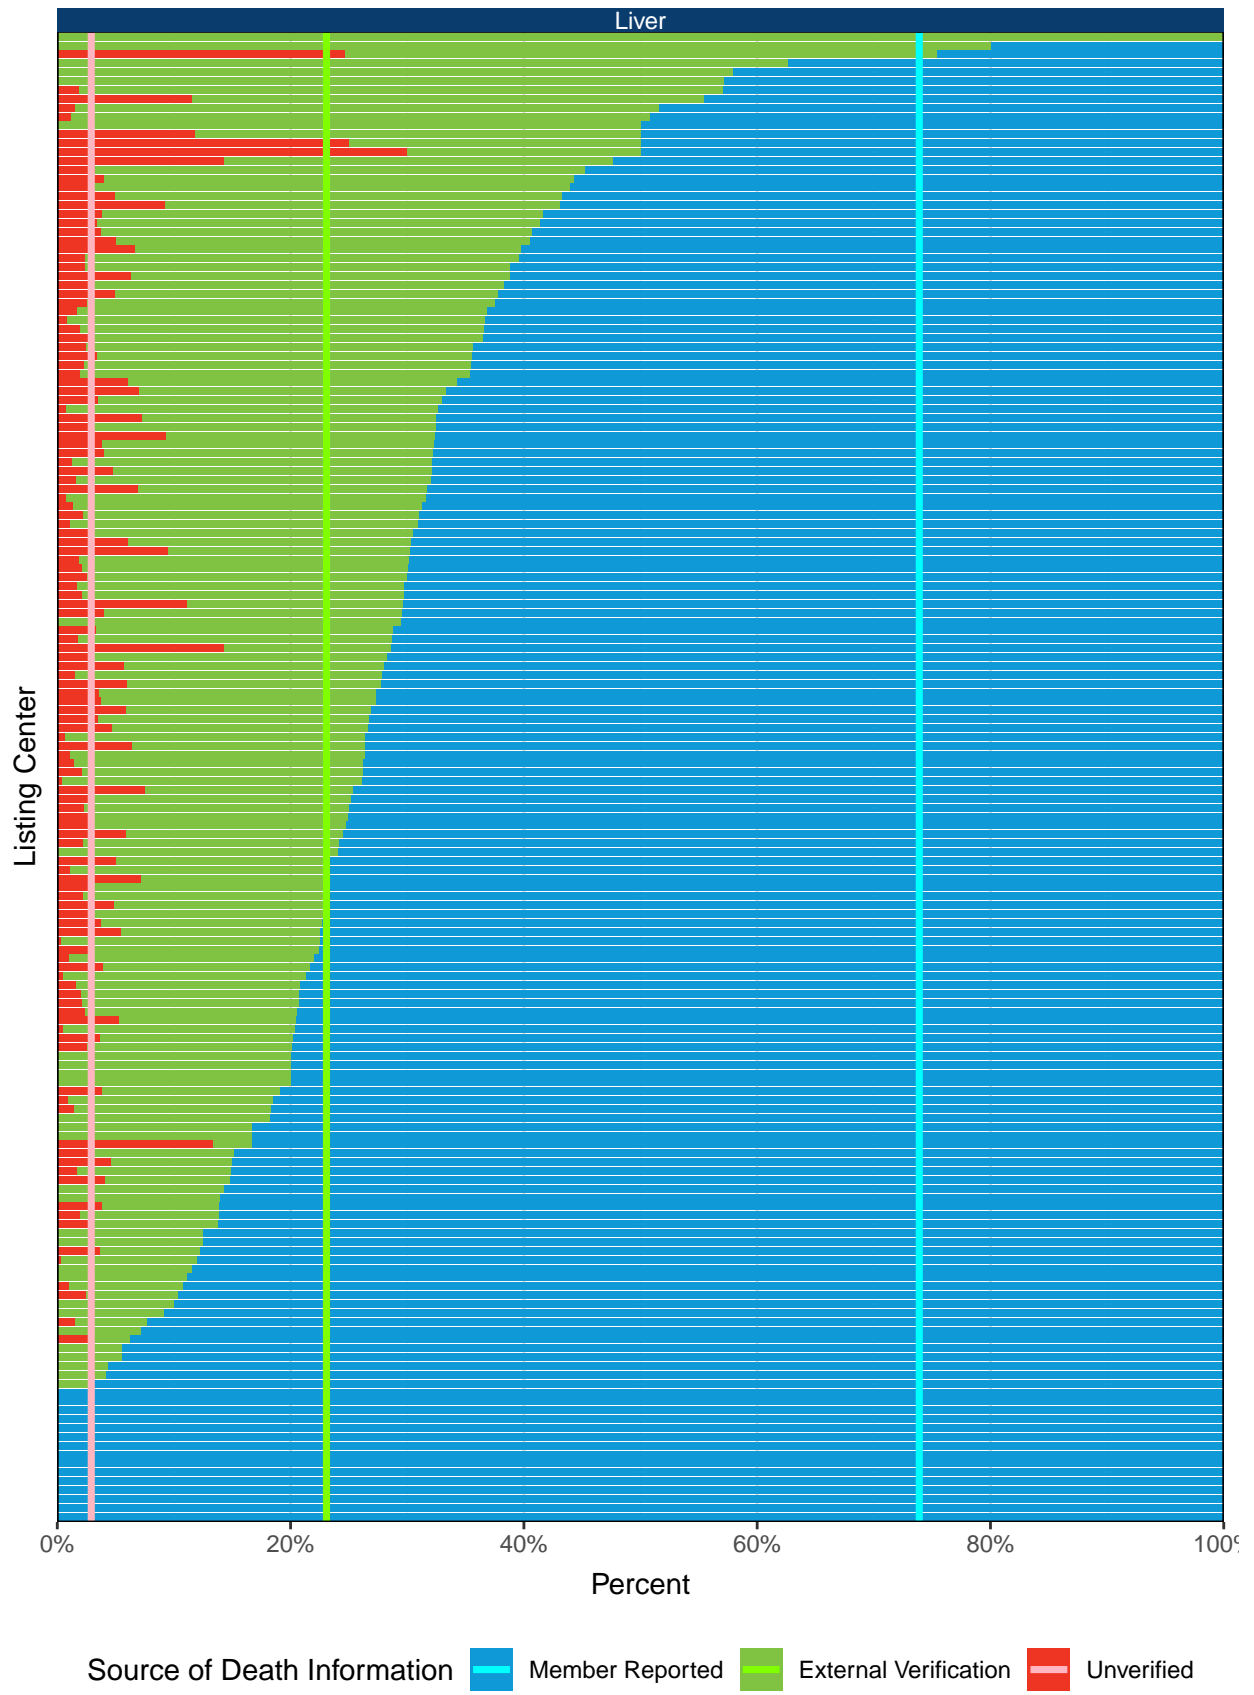

Figure 43: Deaths for waitlist registrations not removed for transplant during January 1, 2005 - December 31, 2021 by organ, candidate listing center, and source of death information. Vertical lines represent medians across centers.

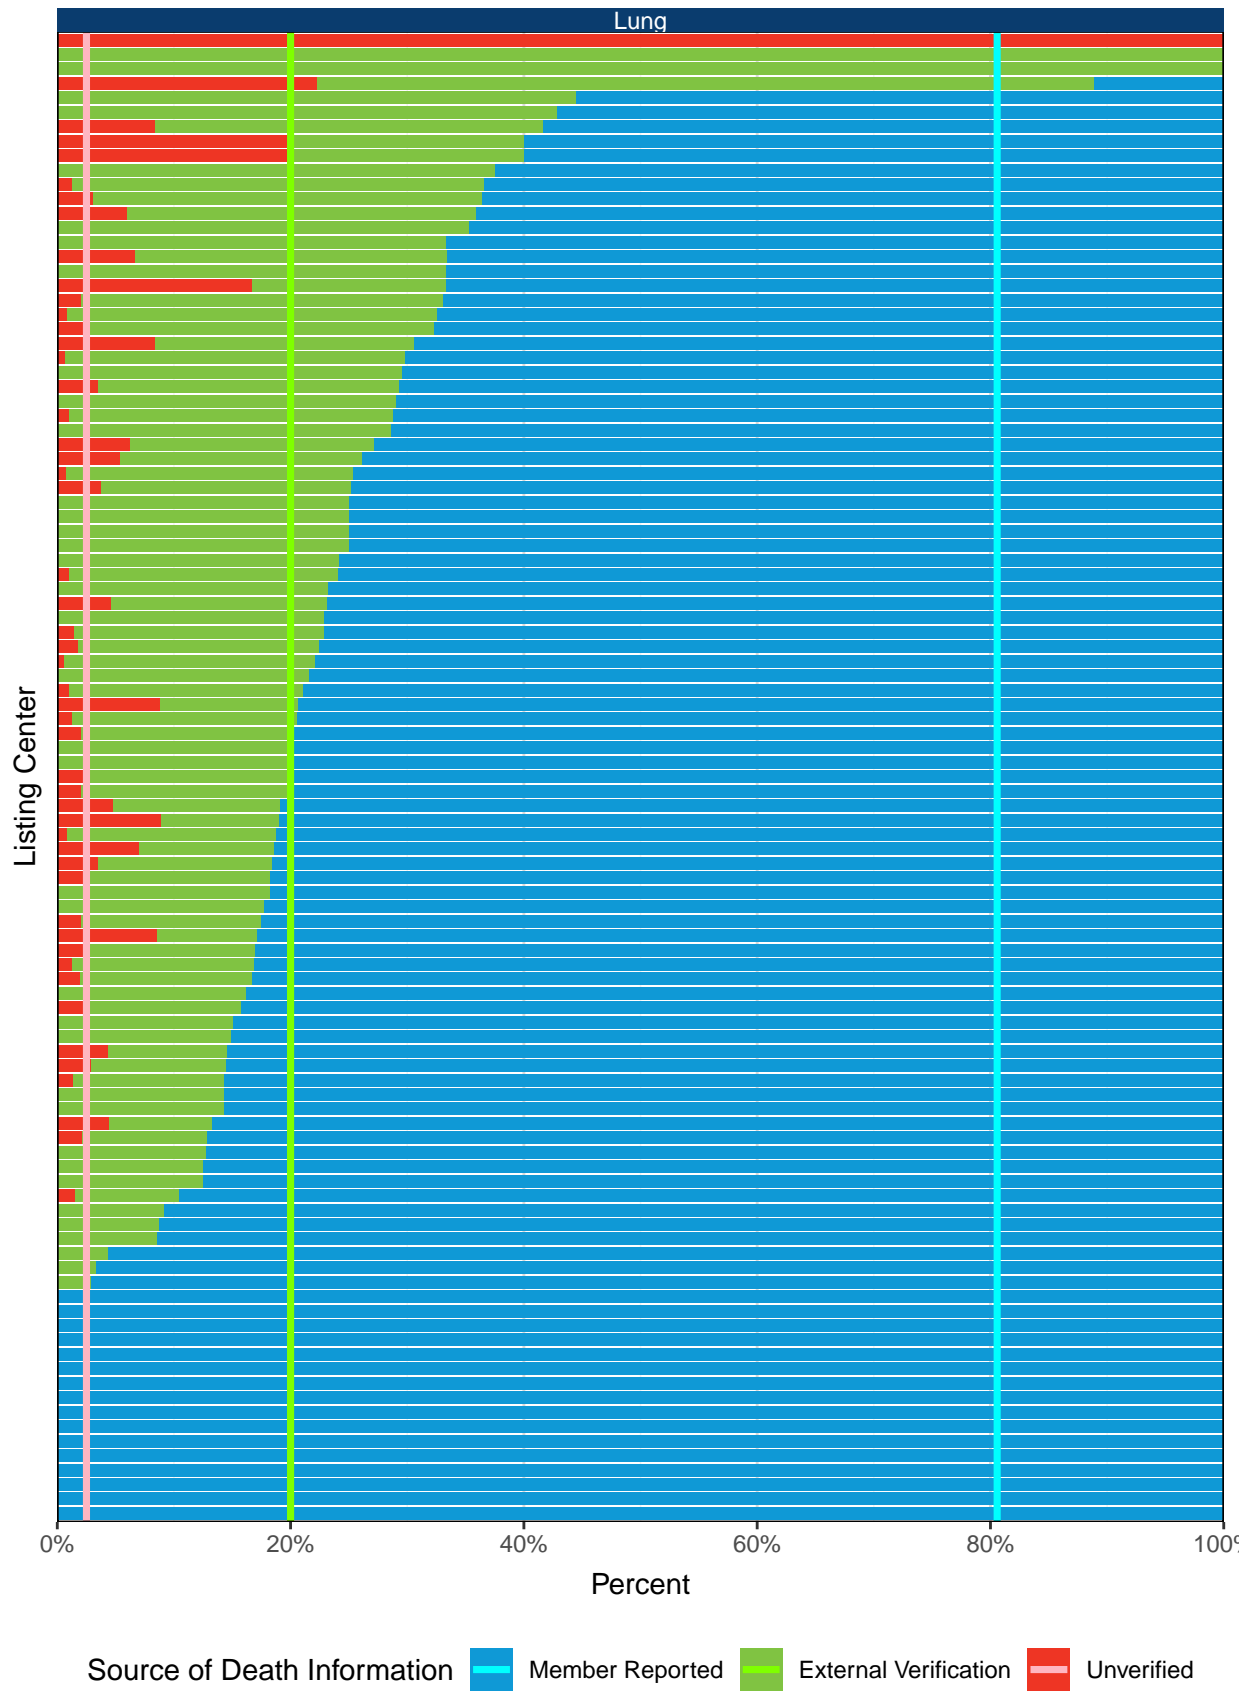

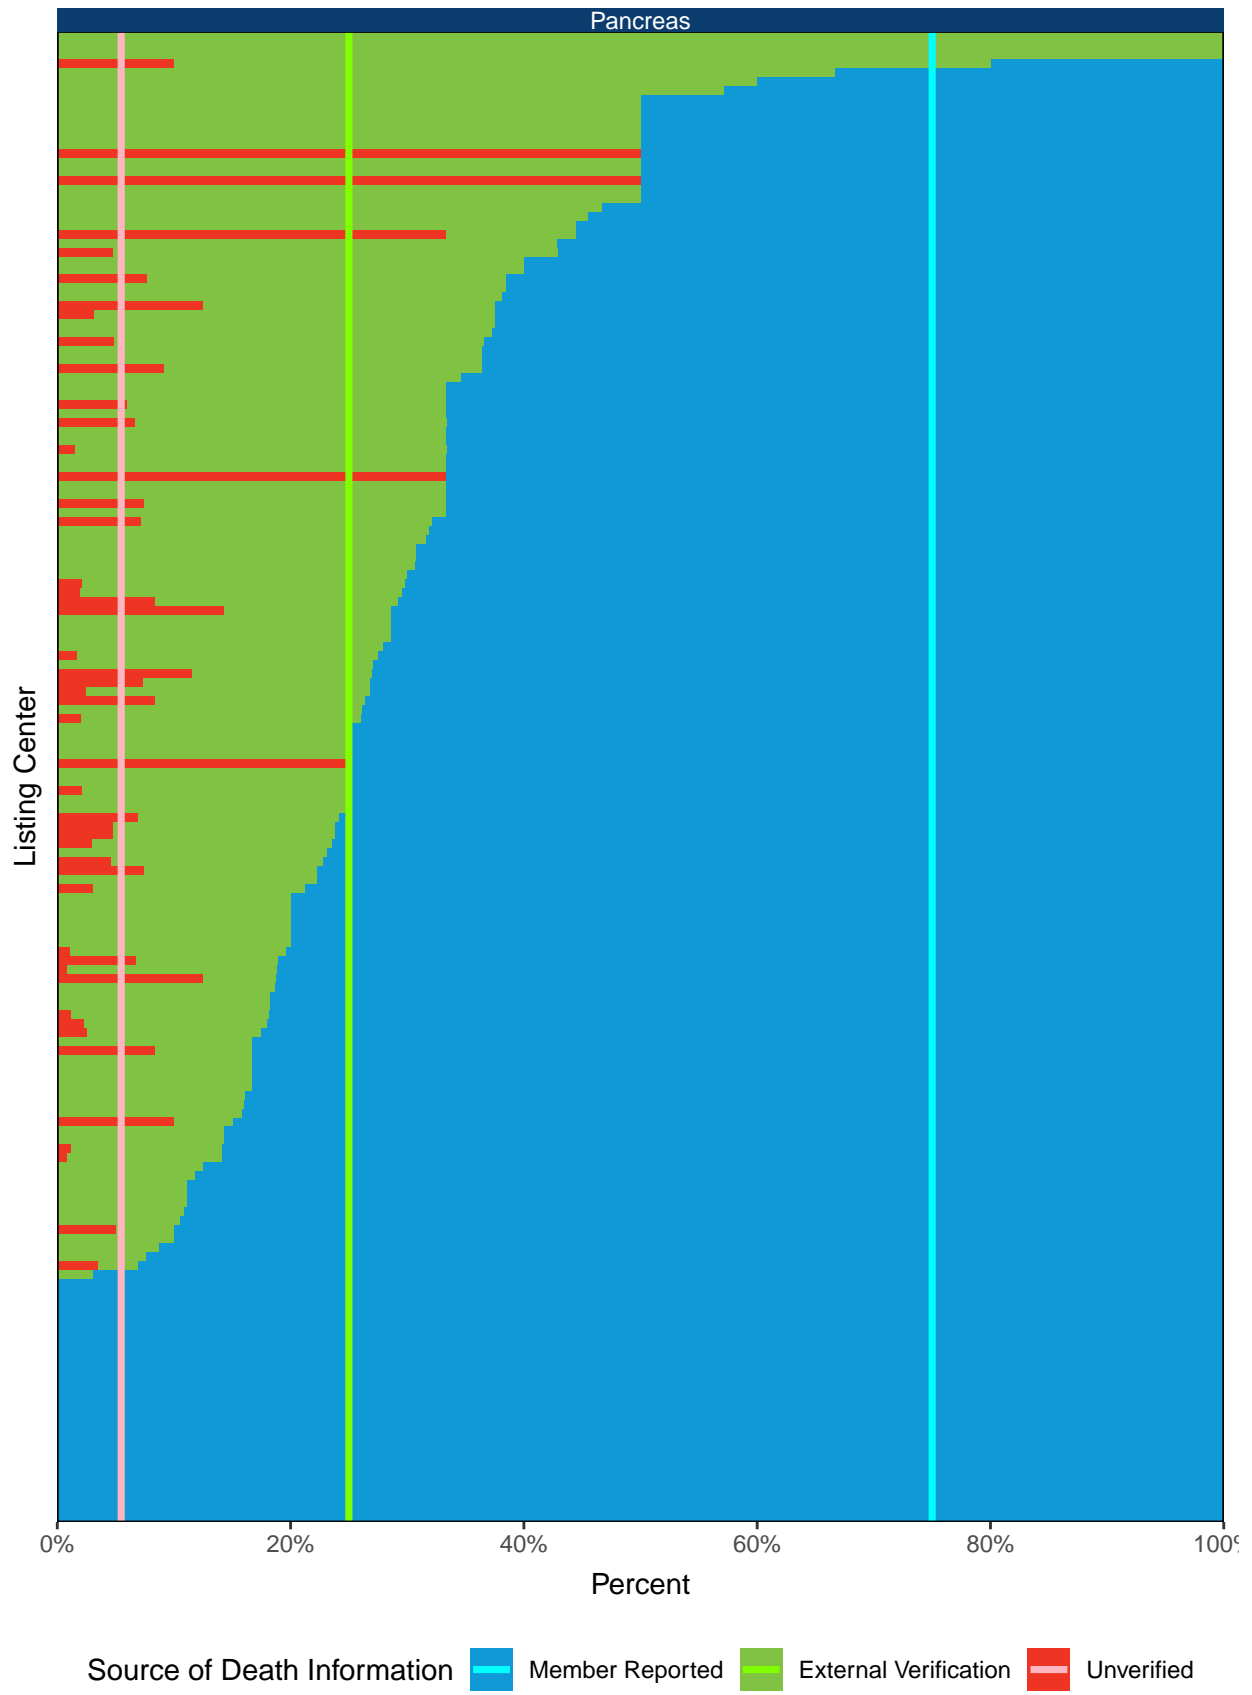

### All Waitlist Registrations

Because there were few deaths for heart-lung and intestine waitlist registrations from externally verified sources or unverified, these organs will be excluded in the graphics and tables in the rest of this section.

Table 49: Deaths for all waitlist registrations during January 1, 2005 - December 31, 2021 by organ and source of death information.

Organ	Member Reported		External Verification		Unverified	
	N	%	N	%	N	%
Heart	37063	87.3%	4705	11.1%	695	1.6%
Heart-Lung	859	92.5%	62	6.7%	8	0.9%
Intestine	1902	95.7%	78	3.9%	7	0.4%
Kidney	243306	72.3%	79443	23.6%	13550	4.0%
Kidney-Pancreas	12888	78.3%	3113	18.9%	463	2.8%
Liver	99798	82.6%	17843	14.8%	3201	2.6%
Lung	28724	92.6%	2044	6.6%	258	0.8%
Pancreas	6589	79.8%	1493	18.1%	179	2.2%
TOTAL	431129	77.2%	108781	19.5%	18361	3.3%

Similar patterns for all waitlist registrations are illustrated here as there were in Figures 34 and 35; however, there is a much larger proportion of deaths that are greater than 5 years from removal which corresponds to including removals for transplant in this cohort.

Figure 44: Deaths for all waitlist registrations during January 1, 2005 - December 31, 2021 by organ, year removed, and source of death information.

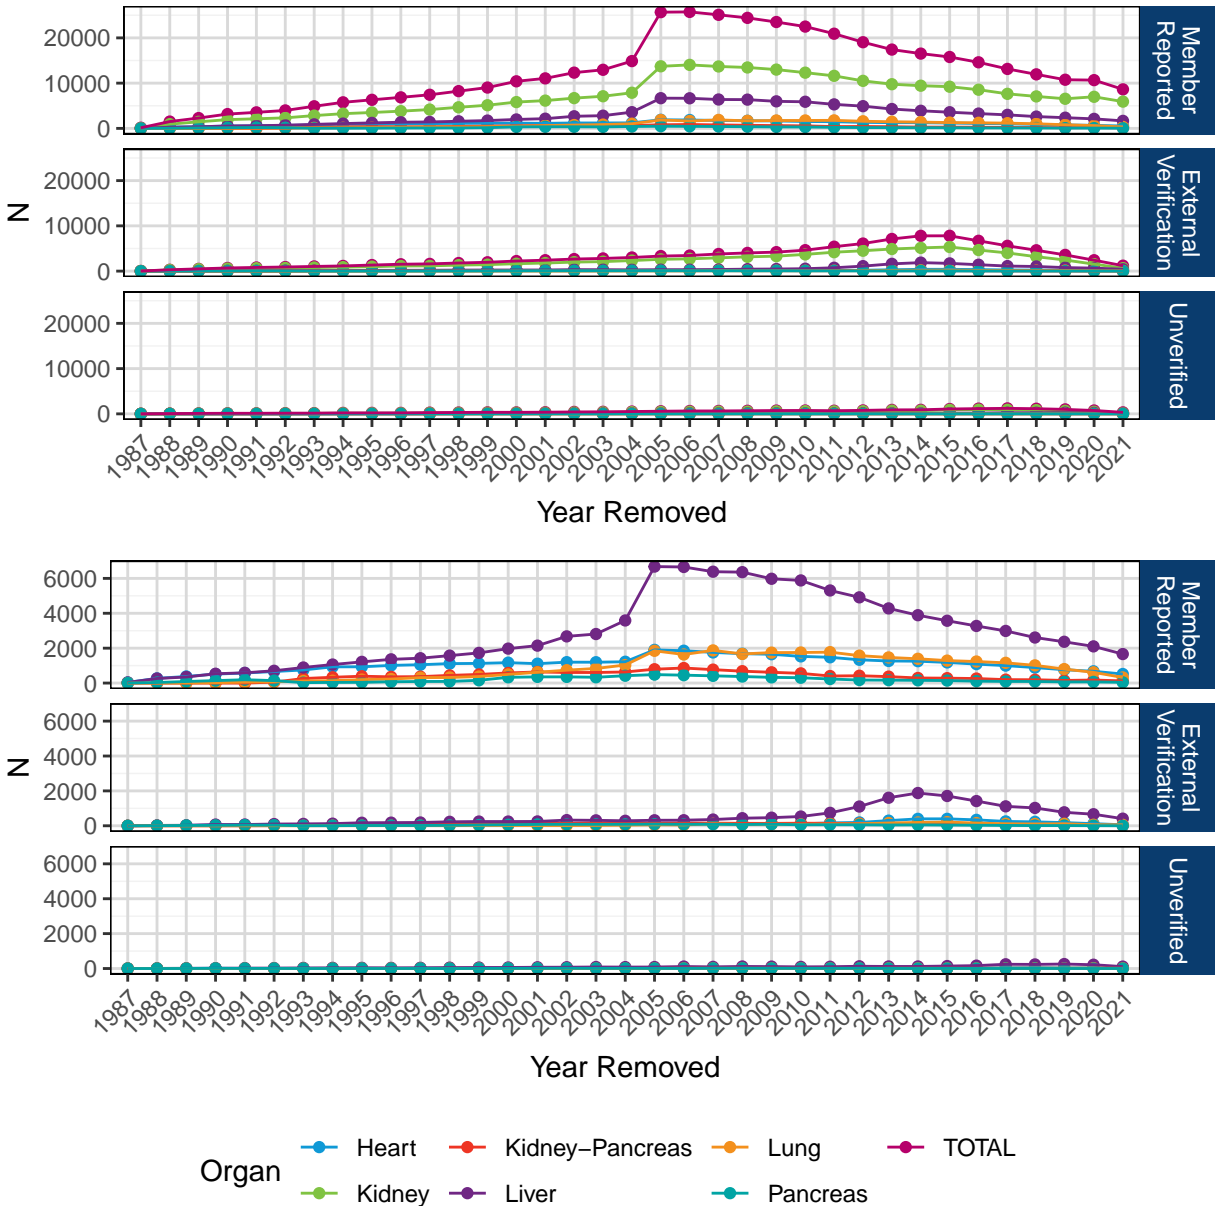

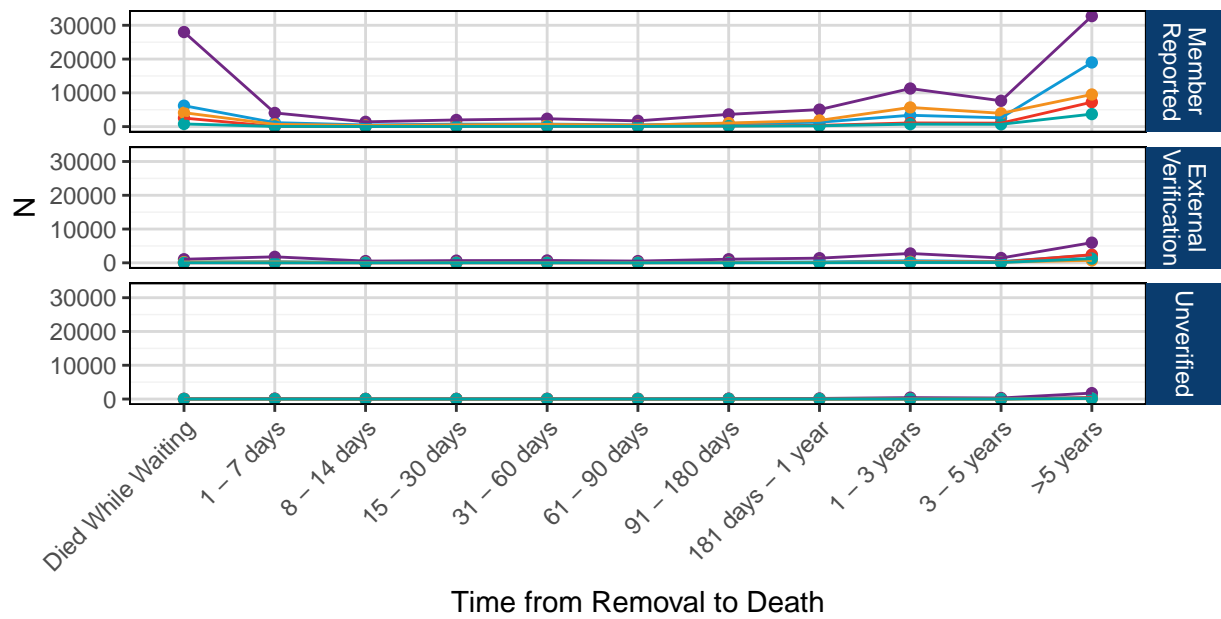

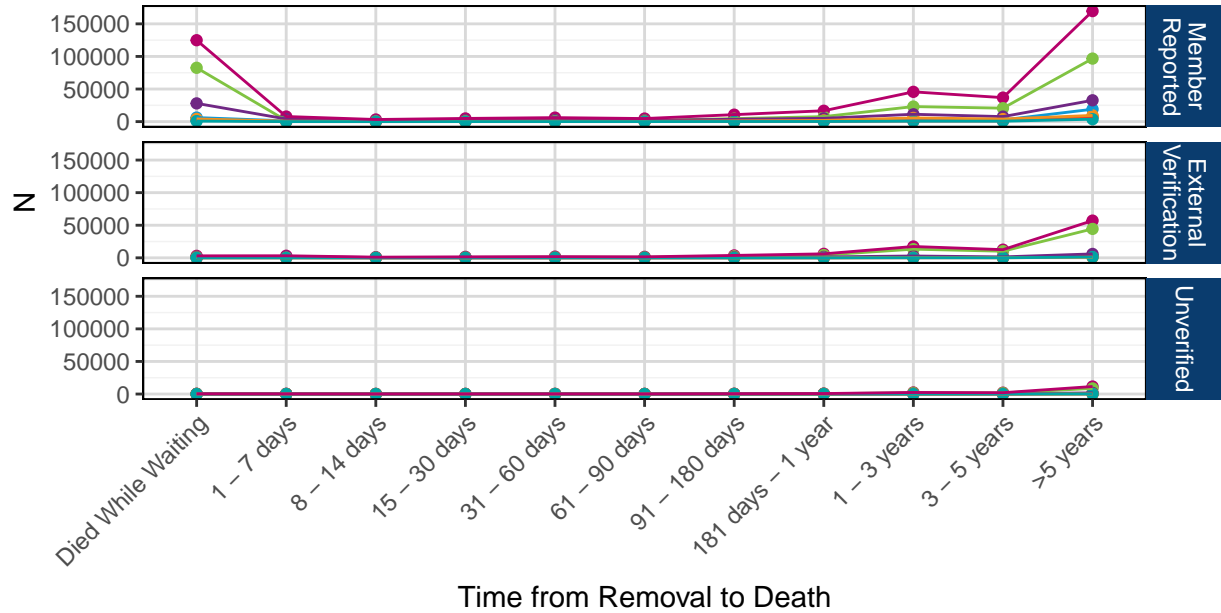

Figure 45: Deaths for all waitlist registrations during January 1, 2005 - December 31, 2021 by organ, time from removal to death, and source of death information.

\* Counts less than 10 not shown. Column percentages add to 100% within each organ.

For all waitlist registrations, member-reported deaths most often occurred with removal reasons “Transplanted” followed by “Died”. Externally verified deaths for all waitlist registrations occurred with removal reasons “Candidate condition deteriorated, too sick to transplant” followed by “Other” or “Transplanted” for heart, liver, and lung waitlist registrations. For kidney, kidney-pancreas, and pancreas waitlist registrations, most externally verified deaths occurred with removal reason “Transplanted” followed by “Other” or “Candidate condition deteriorated, too sick to transplant”. Lastly, unverified deaths for all waitlist registrations across organs occurred most often with the removal reason “Transplanted” followed by “Other”.

The table below provides a summary of the distribution of the number of deaths, from each death source, per listing center state for each organ. Across organs and death sources, the number of waitlist registration deaths per state is right-skewed.

Table 52: Summary of number of deaths for all waitlist registrations during January 1, 2005 - December 31, 2021 per listing center state by organ and source of death information. Listing center states for each organ type included if at least one death.

Similarly, Table 53 provides a summary of the percentage of waitlist registration deaths per listing center state from member reported, externally verified, or unverified sources of death information. This is given per state across each organ. For lung and liver waitlist registrations, a minimum of 80% and 73%, respectively, of deaths are member reported across all states. However, there were no states with 100% of kidney or liver waitlist registrations as member reported.

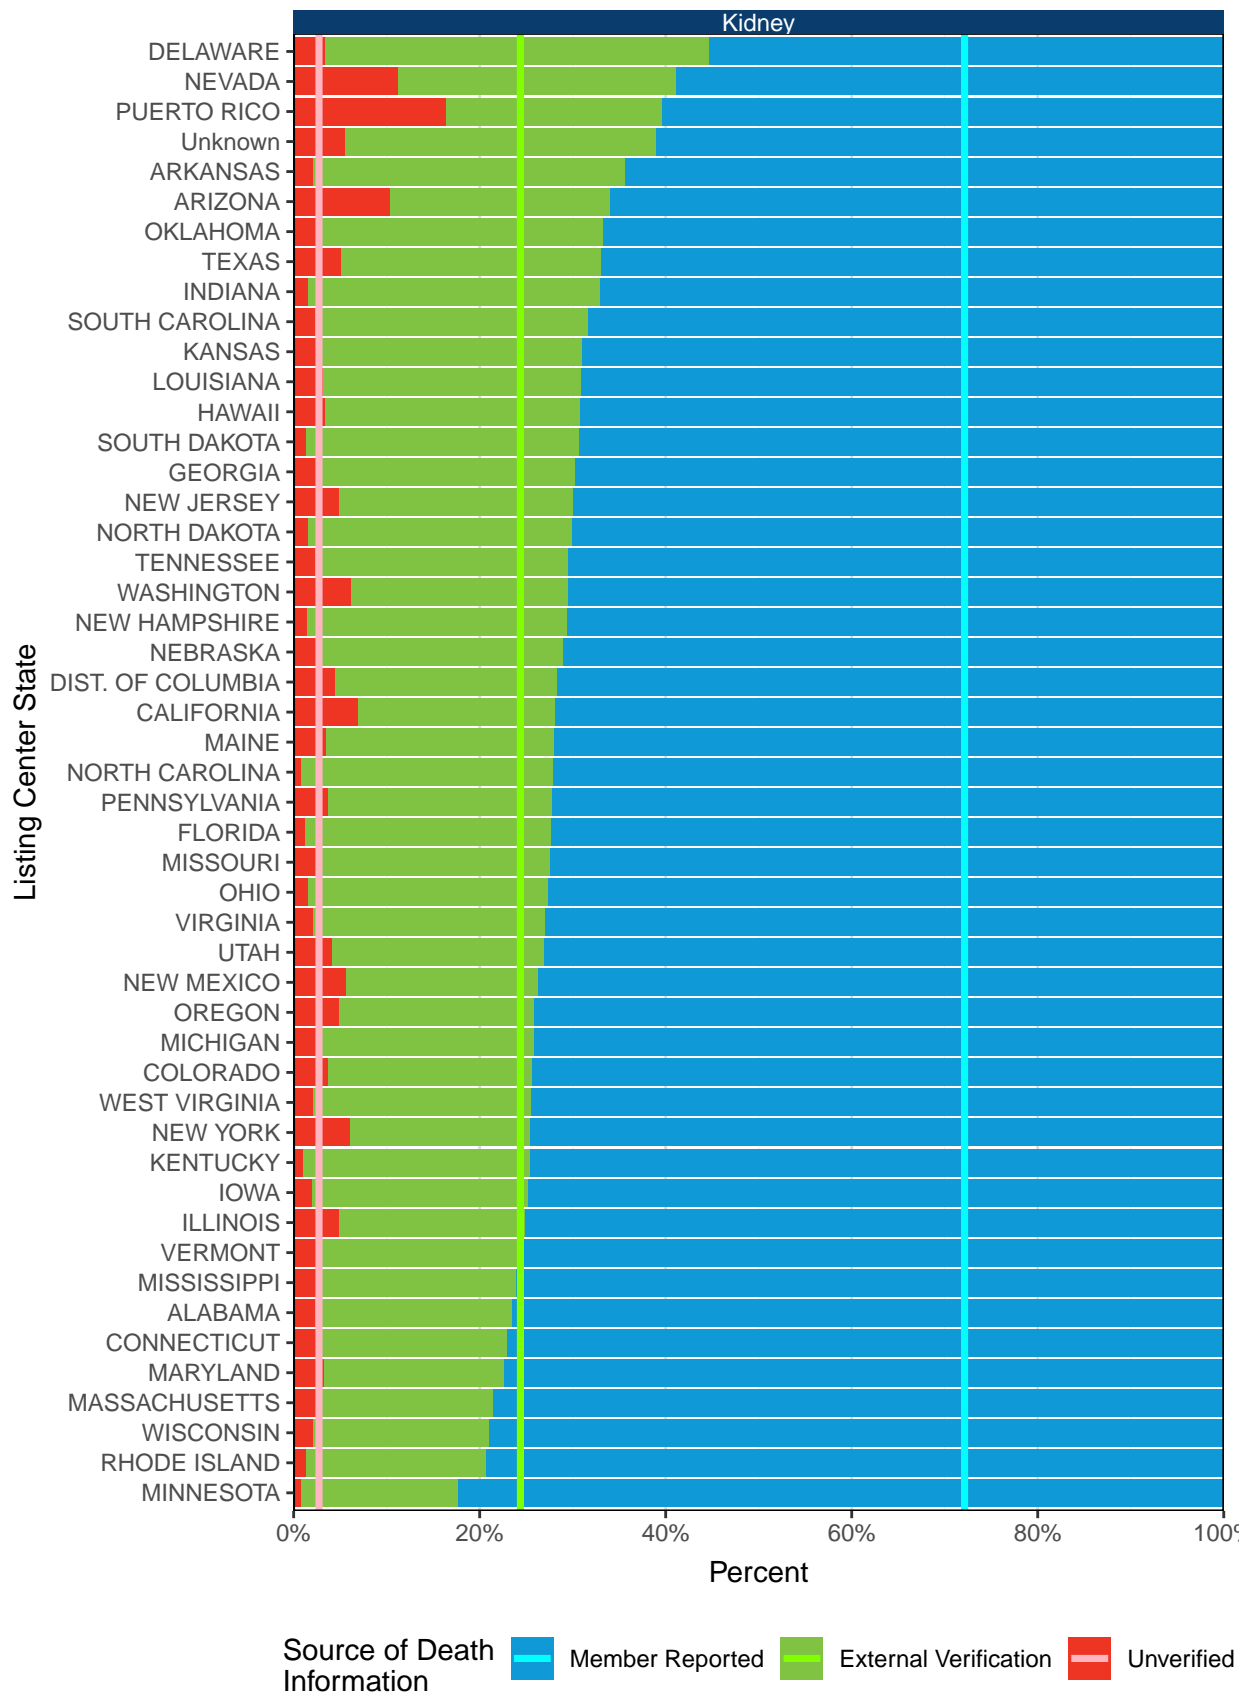

The following figures illustrate the distribution of percentages of source of death information per state for each organ.

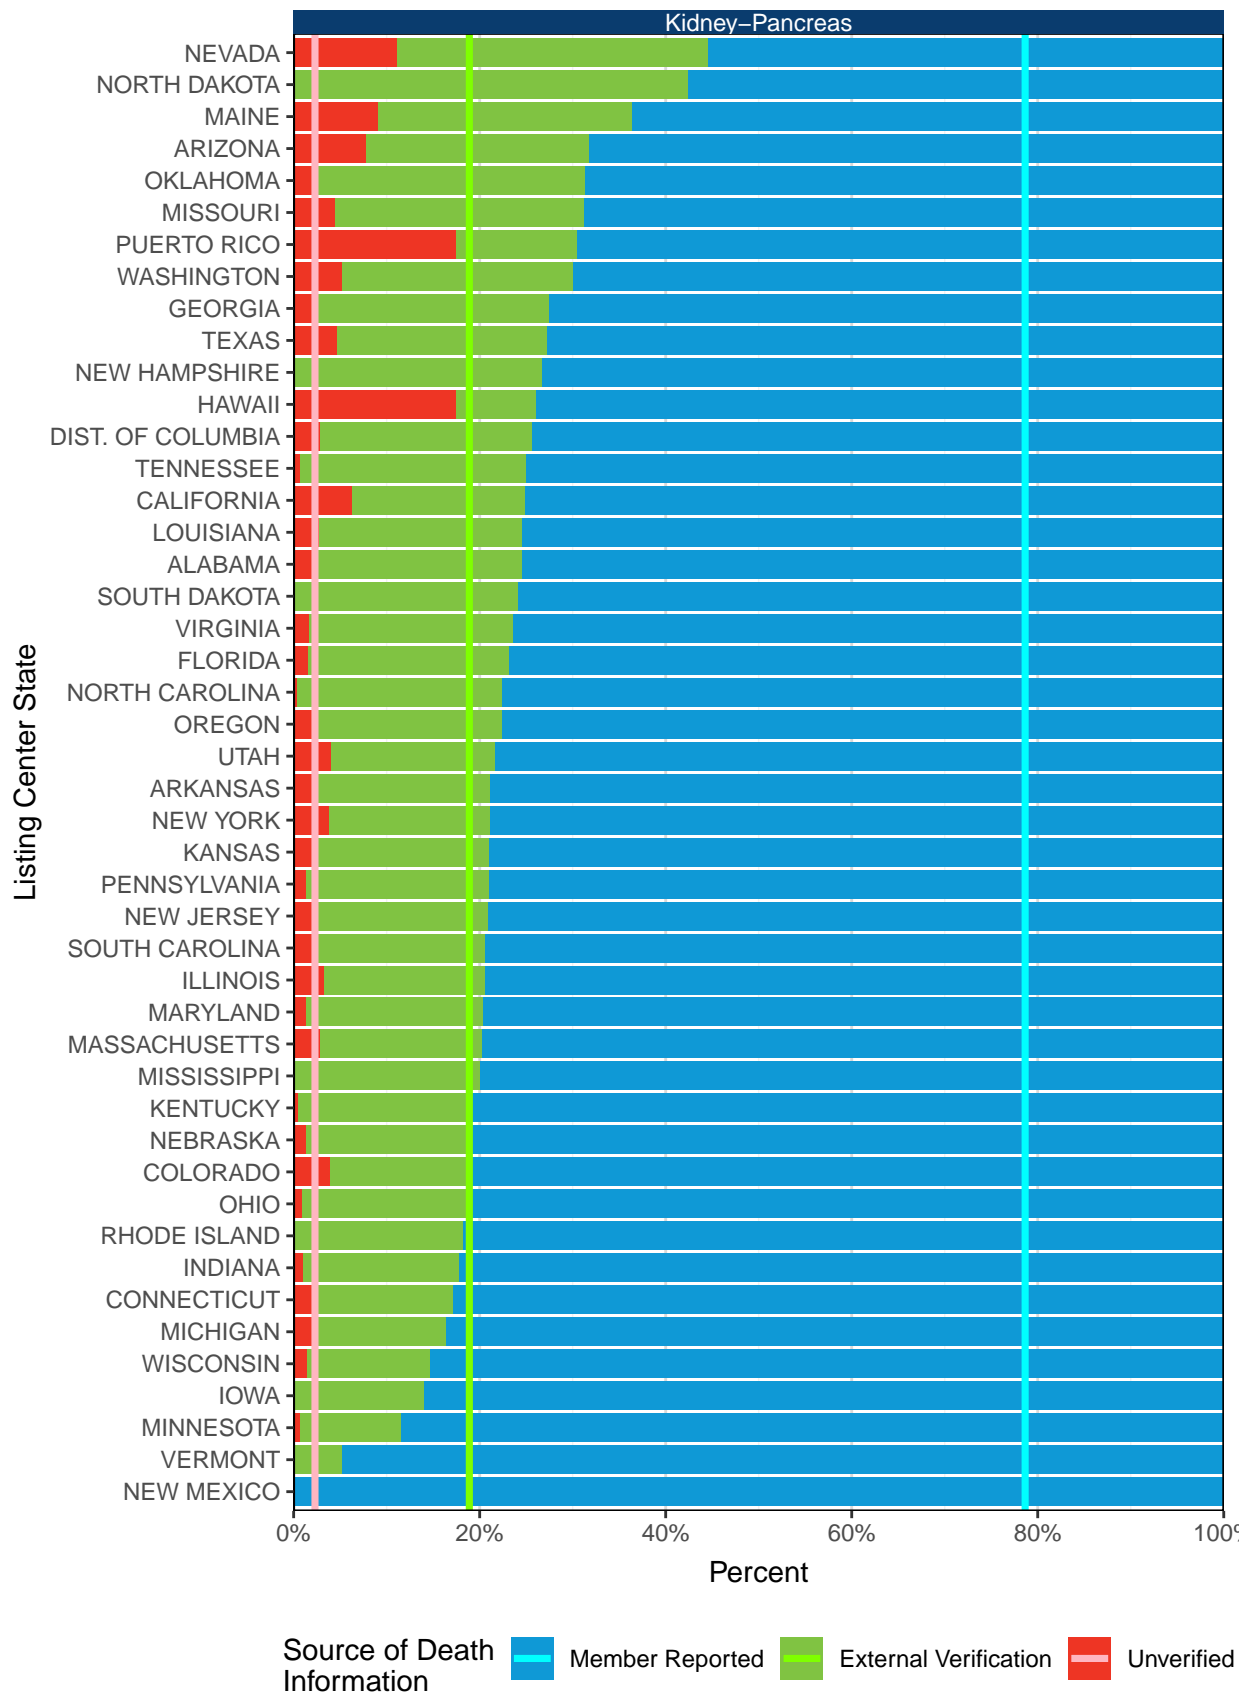

Table 53: Summary of percent of deaths for all waitlist registrations during January 1, 2005 - December 31, 2021 per listing center state by organ and source of death information. Listing center states for each organ type included if at least one death.

The table below provides a summary of the percentage of waitlist registration deaths per listing center from member reported, externally verified, or unverified sources of death information. This is given per center across each organ. Half of all listing centers had at least 75% of all waitlist registration deaths as member reported.

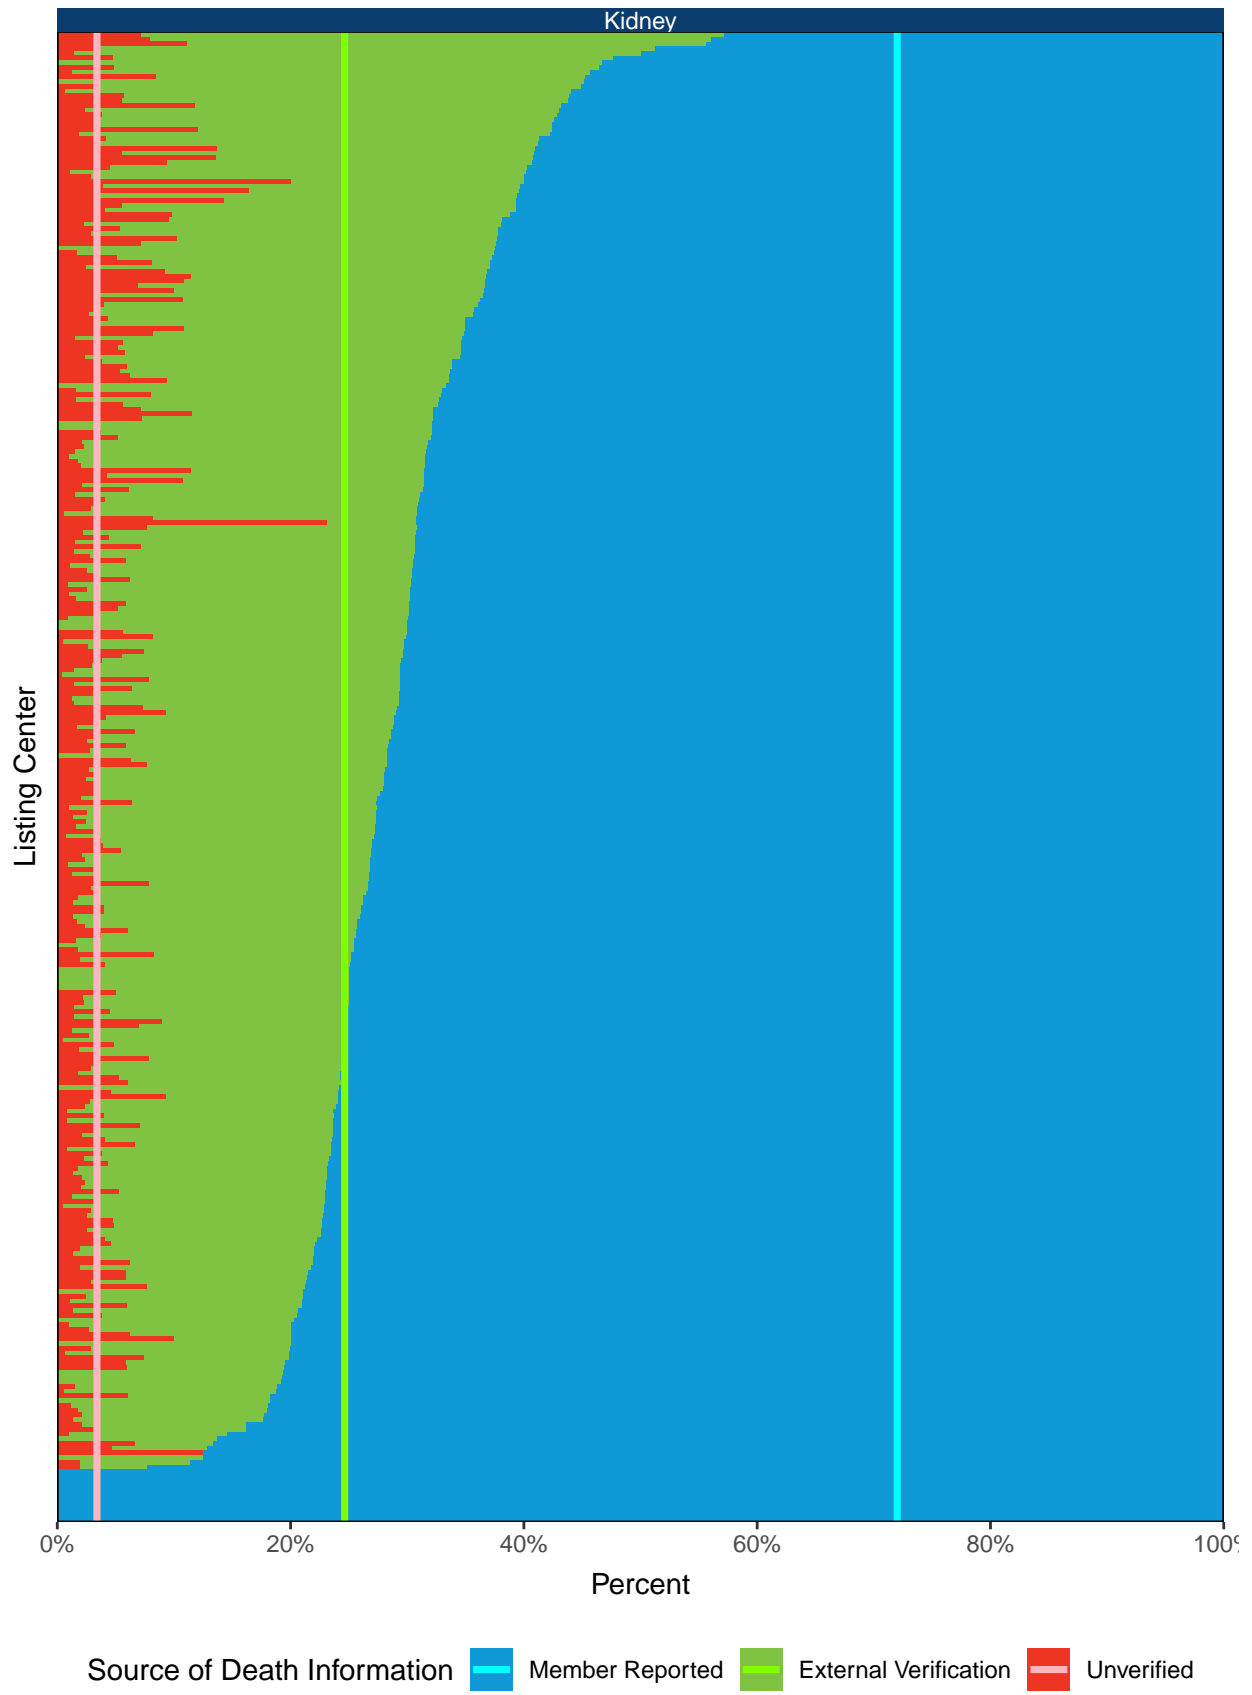

The following figures illustrate the distribution of percentages of source of death information per center for each organ.

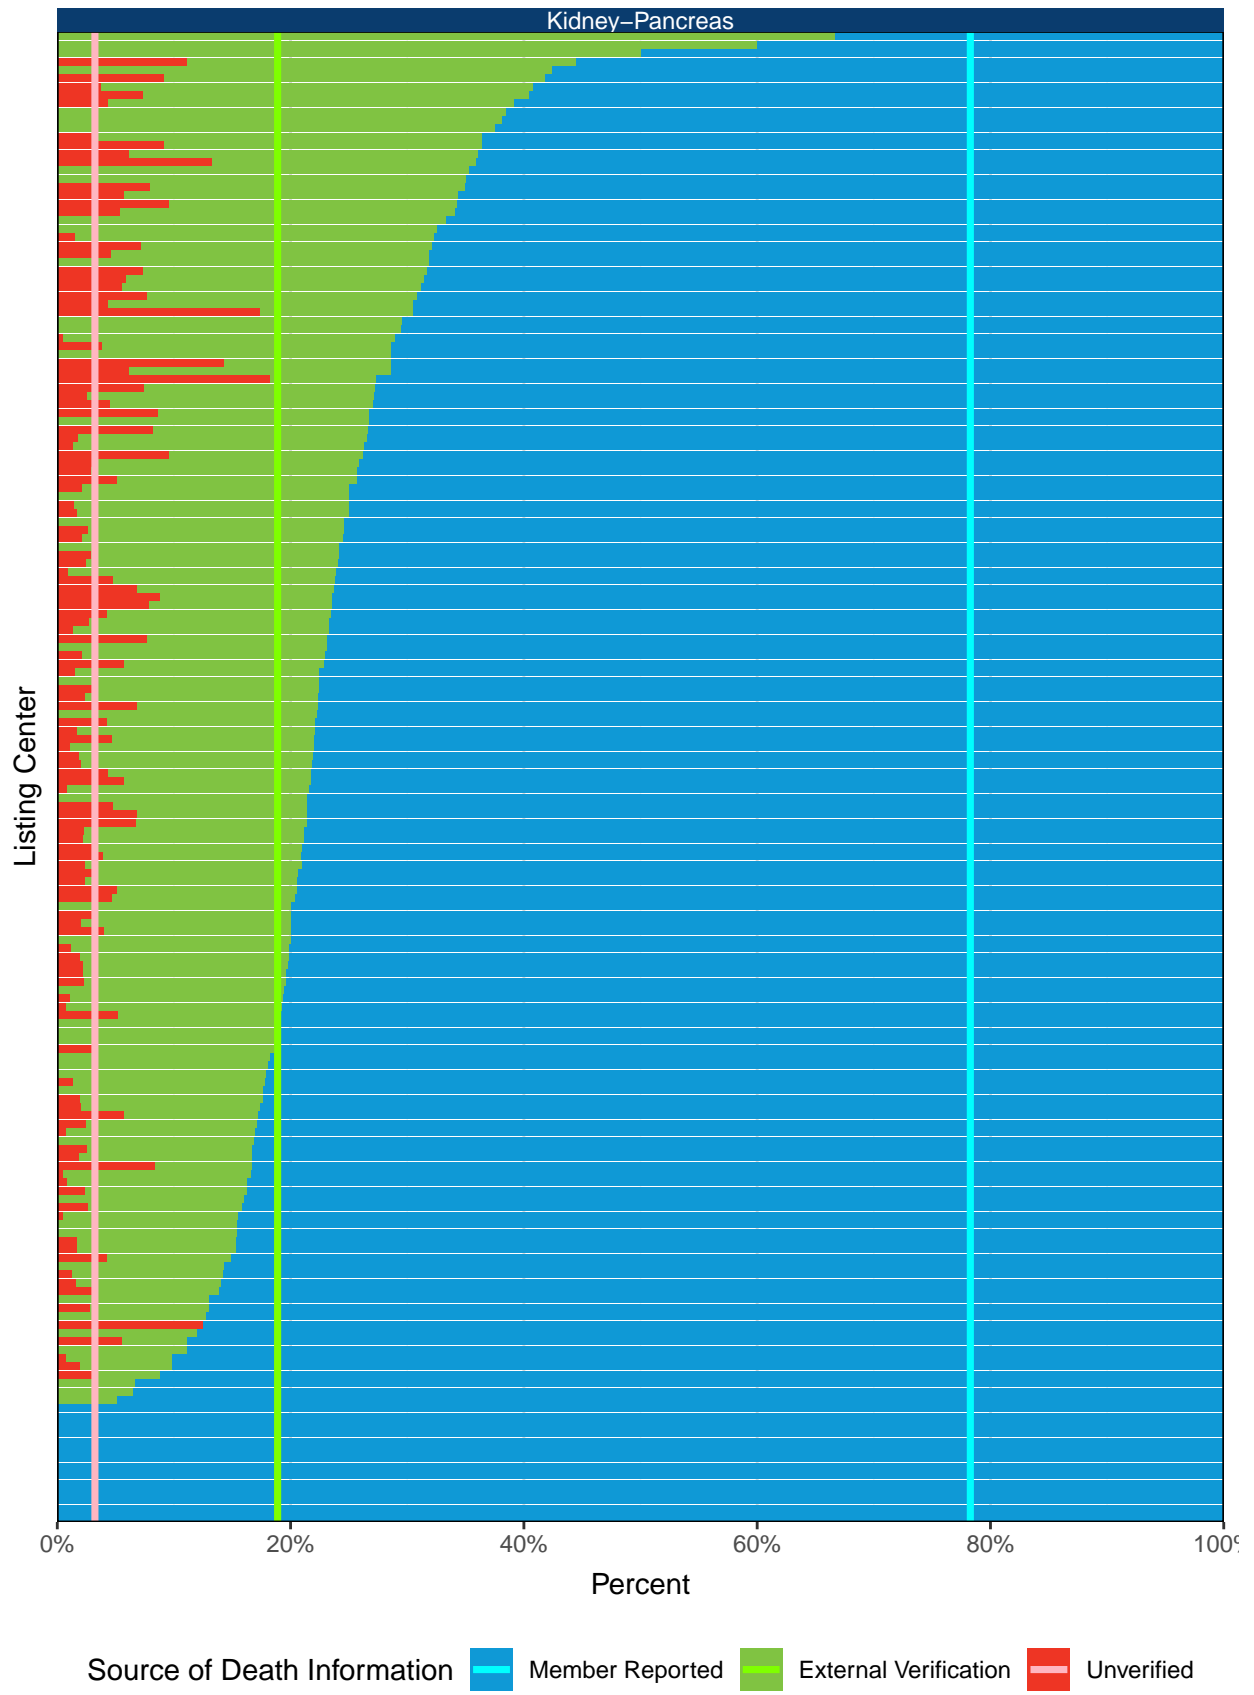

Table 55: Summary of percent of deaths for all waitlist registrations during January 1, 2005 - December 31, 2021 per listing center by organ and source of death information. Listing centers for each organ type included if at least one death.
